

# EtherCAT Mode

# 12

This chapter provides details for the required parameter settings when the servo communicates with the controller through the EtherCAT communication function.

## 12.1 Basic configuration

### 12.1.1 Hardware configuration

The pin assignments of the two ports of the EtherCAT connector (CN6) are the same. Note that the IN port is for connecting the controller or the previous servo drive, and the OUT port is for connecting the next servo drive or not connecting to other devices. Incorrect wiring will lead to communication error.

12

(1) CN6 connector (female); (2) CN6 connector (male)

Pin assignment:

| Transmission port | Pin No. | Signal | Function description |
|-------------------|---------|--------|----------------------|
| IN                | 1       | TX+    | Transmit +           |
|                   | 2       | TX-    | Transmit -           |
|                   | 3       | RX+    | Receive +            |
|                   | 4       | -      | Reserved             |
|                   | 5       | -      | Reserved             |
|                   | 6       | RX-    | Receive -            |
|                   | 7       | -      | Reserved             |
|                   | 8       | -      | Reserved             |
| OUT               | 9       | TX+    | Transmit +           |
|                   | 10      | TX-    | Transmit -           |
|                   | 11      | RX+    | Receive +            |
|                   | 12      | -      | Reserved             |
|                   | 13      | -      | Reserved             |
|                   | 14      | RX-    | Receive -            |
|                   | 15      | -      | Reserved             |
|                   | 16      | -      | Reserved             |

# 12

Description of each indicator for the CN6 connector:

■ LED indicator status description

| Indicator    | Description                |
|--------------|----------------------------|
| On           | <p>ON —————</p> <p>OFF</p> |
| Blinking     | <p>ON</p> <p>OFF</p>       |
| Single flash | <p>ON</p> <p>OFF</p>       |
| Off          | <p>ON</p> <p>OFF —————</p> |

■ Network status indicator (L/A)

| Indicator | Status  | Description   |
|-----------|---|---|
| On        | Network is connected  | Network connection is established but no data transmission. |
| Blinking  | Network connection is established and data is in transmission | Data is in transmission.                                    |
| Off       | No connection   | Network connection is not established.                      |

■ EtherCAT connection status indicator (RUN)

| Indicator    | Status           | Description   |
|--------------|------------------|---|
| Off          | Init             | After power cycling and the initialization of the servo drive is complete, the communication has not yet started, but the controller can access the servo drive's register. |
| On           | Operational      | SDO, TxPDO, and RxPDO data packets can be transmitted.  |
| Blinking     | Pre-Operational  | The controller can exchange data through the mailbox.   |
| Single flash | Safe-Operational | The servo drive can use the SDO and TxPDO data packets to exchange data with the controller.  |

■ EtherCAT error indicator (ERR)

| Indicator    | Status                                    | Description   |
|--------------|---|---|
| Off          | No error                                  | No error has occurred.  |
| On           | PDI Watchdog timeout                      | Servo drive malfunction. Contact the distributor for assistance.  |
| Blinking     | State change error                        | Parameter setting error causes the system unable to switch the state. Refer to Figure 12.1.1.1.                   |
| Single flash | Synchronization error / SyncManager error | The synchronization between the controller and the servo drive failed or the data was lost during data reception. |

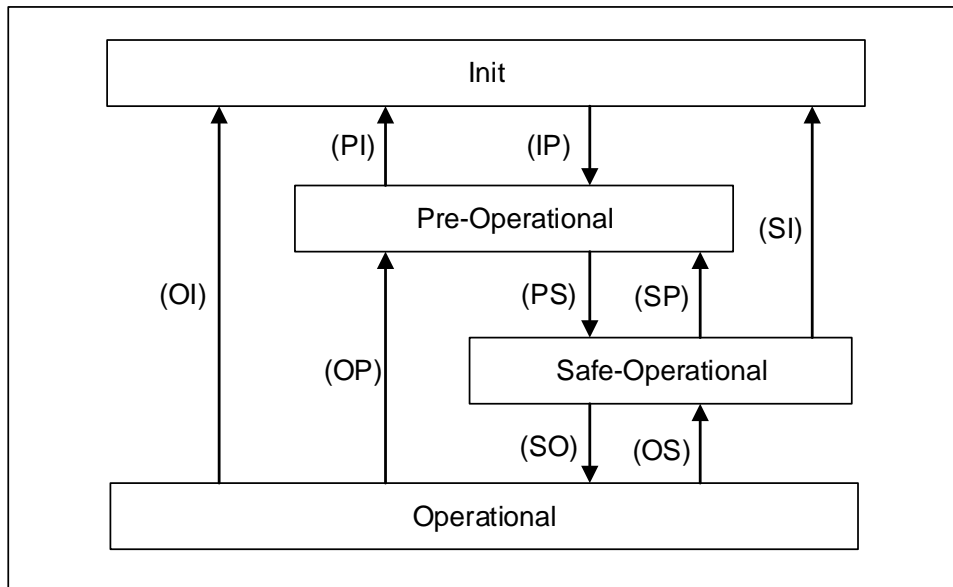

Figure 12.1.1.1 EtherCAT State Machine

Connecting multiple servo drives:

Note:

1. When multiple servo drives are connected, the maximum distance between each drive is 50 m (164.04 inches).
2. Use CAT5e STP cable.
3. It is suggested that you use a Beckhoff cable (model number: ZB9020).
4. Ensure the wiring is correct. The IN port is for connecting the controller or the previous servo drive, and the OUT port is for connecting the next servo drive or not connecting to other devices.

## 12

### 12.1.2 ESI file import

The EtherCAT motion control fieldbus is an open standard that requires using the ESI (EtherCAT Slave Information) file to configure the functions and related object properties for each slave device. Generally, the ESI file is an XML file.

#### Delta controller

No need to import ESI files.

#### Non-Delta controller

Import the ESI file of the slave device to the controller software, so the controller can recognize and control each slave device according to the configuration in the ESI file. An ESI file may contain data of multiple devices. Delta's A3-E and B3-E servo drives share the same ESI file. To import ESI files to non-Delta controllers, refer to the manufacturer's instruction manual.

Download the dedicated ESI file for the A3-E and B3-E servo drives from the [Download Center](#) of Delta's website.

After being imported to the non-Delta controller software, the ESI files are stored in the following paths:

#### Beckhoff TwinCAT

TwinCAT 2: C:\TwinCAT\IO\EtherCAT

TwinCAT 3: C:\TwinCAT\3.1\Config\Io\EtherCAT

#### Omron Sysmac Studio

C:\Program Files (x86)\OMRON\Sysmac Studio\IODeviceProfiles\EsiFiles\UserEsiFiles

Note: refer to the manufacturer's instruction manual of each controller for the actual storage path.

### 12.1.3 Parameter settings of EtherCAT mode

Follow these instructions to connect the EtherCAT controller and the servo drive:

1. Set to EtherCAT mode: set P1.001.YX to 0C.
2. Set the slave address: set P3.000 to 0x0001 - 0x007F.
3. It is suggested that you change the setting value of P3.012.Z from 0 (default) to 1 to enable the non-volatile setting for the parameter. Note that the default E-Gear ratio varies with the set value of P3.012.Z.

12

| Settings  | P3.012 = 0x0100 (Z = 1) |                                 | P3.012 = 0x0000 (Z = 0) |                                     |
|---|-------------------------|---------------------------------|-------------------------|-------------------------------------|
|   | Servo parameter         | Default                         | OD address              | Default                             |
| Motor stop mode   | P1.032                  | 0x0000                          | 605Bh                   | 0                                   |
| S-curve acceleration constant                             | P1.034                  | 200                             | 6087h                   | 200                                 |
| Zero speed range  | P1.038                  | 100<br>(0.1 rpm)                | 606Fh                   | 100<br>(0.1 rpm)                    |
| E-Gear ratio - numerator N1                               | P1.044                  | 16777216                        | 6093h sub1              | 1                                   |
| E-Gear ratio - denominator M                              | P1.045                  | 100000                          | 6093h sub2              | 1                                   |
| Speed reached (DO.SP_OK) range                            | P1.047                  | 10<br>(rpm)                     | 606Dh                   | 100<br>(0.1 rpm)                    |
| Accumulated time to reach desired speed                   | P1.049                  | 0                               | 606Eh                   | 0                                   |
| Maximum speed limit                                       | P1.055                  | Depending on the motor<br>(rpm) | 607Fh                   | Depending on the motor<br>(0.1 rpm) |
|   |                         |                                 | 6080h                   | Depending on the motor<br>(rpm)     |
| Excessive deviation warning condition of Position command | P2.035                  | 50331648                        | 6065h                   | 50331648                            |
| Positive software limit (PP / CSP / CSV / CST mode)       | P5.008                  | 2147483647                      | 607Dh sub2              | 2147483647                          |
| Negative software limit (PP / CSP / CSV / CST mode)       | P5.009                  | -2147483648                     | 607Dh sub1              | -2147483648                         |
| Origin definition (HM mode)                               | P6.001                  | 0                               | 607Ch                   | 0                                   |

# 12

|               |                                      |                |  |

| <b>P3.018</b> | <b>EtherCAT special function switch</b> |                | <b>Address: 0324H<br/>0325H</b> |
| Default:      | 0x00002000                              | Control mode:  | EtherCAT                        |
| Unit:         | -                                       | Setting range: | 0x00000000 - 0x00112211         |
| Format:       | HEX                                     | Data size:     | 32-bit                          |

Settings:

|   |   |   |   |
|---|---|---|---|
| A | Source setting for the content loaded to the EtherCAT Station Alias Register 0x0012 after the servo drive is powered on | X | Unit selection for Target velocity (OD 60FFh) and Velocity actual value (OD 606Ch) when in the PV (Profile Velocity) mode or CSV (Cyclic Synchronous Velocity) mode |
| B | Reserved  | Y | Reserved  |
| C | Unit selection for the maximum speed of OD 607Fh and OD 6080h   | Z | AL185 communication disconnection detection setting   |
| D | Reserved  | U | Reserved  |

- A: source setting for the content loaded to the EtherCAT Station Alias Register 0x0012 after the servo drive is powered on.
  - 0: determined by the EtherCAT EEPROM station number field (ADR 0x0004) setting, which needs to be set via the controller interface.
  - 1: determined by the address set with servo parameter P3.000.
- X: unit selection for Target velocity (OD 60FFh) and Velocity actual value (OD 606Ch) when in the PV (Profile Velocity) mode or CSV (Cyclic Synchronous Velocity) mode
  - 0: 0.1 rpm
  - 1: pulse/sec
- Z: AL185 communication disconnection detection setting
  - 0: disconnection detection starts after EtherCAT communication enters OP state.
  - 1: disconnection detection starts after EtherCAT communication enters Init state.
  - 2: disable disconnection detection.

Note: when using the ring topology connection, set P3.018.Z to 2 to disable the disconnection detection.
- C: unit selection for the maximum speed of OD 607Fh and OD 6080h
  - 0: 0.1 rpm for OD 607Fh and rpm for OD 6080h.
  - 1: pulse/sec for OD 607Fh and OD 6080h.

| P3.022   | EtherCAT PDO timeout setting |                | Address: 032CH<br>032DH |
|----------|------------------------------|----------------|-------------------------|
| Default: | 0xFF04                       | Control mode:  | EtherCAT                |
| Unit:    | -                            | Setting range: | 0x0002 - 0xFF14         |
| Format:  | HEX                          | Data size:     | 16-bit                  |

Settings:

When using the PDO to transmit data periodically, use this parameter to set the timeout setting. The following two sets of digits specify the trigger conditions for AL180 and AL3E3 respectively to ensure that the servo drive receives the PDO. When one of the alarm occurs, it means the allowable duration for packet loss exceeds the set range.

| Digit    | UZ                               | YX                      |
|----------|----------------------------------|-------------------------|
| Function | AL180 trigger condition          | AL3E3 trigger condition |
| Range    | 0x00 (disabled) - 0xFF (default) | 0x02 - 0x14             |

- YX: AL3E3 trigger condition (allowable cycle for elapsed time); applicable to CSP / CSV / CST mode.
  - AL3E3 occurs when the servo drive does not receive the PDO within the set cycle.
  - When the communication cycle is 4 ms and you set this parameter to 0x02 (allow two cycles), it means if the servo drive does not receive any PDO within 8 ms, AL3E3 occurs.

# 12

- UZ: AL180 trigger condition (allowable duration for elapsed time); applicable to all operation modes.

AL180 occurs when the servo drive does not receive the PDO within the set duration (unit: ms). For example, when you set P3.022.UZ to 0x01, the duration is 1 ms; when you set P3.022.UZ to 0x02, the duration is 2 ms; and when you set P3.022.UZ to 0xFF, the duration is 255 ms.

| P0.002   | Drive status |                | Address: 0004H<br>0005H |  |
|----------|--------------|----------------|-------------------------|--|
| Default: | 1            | Control mode:  | All                     |  |
| Unit:    | -            | Setting range: | -300 to +127            |  |
| Format:  | DEC          | Data size:     | 16-bit                  |  |

Settings:

Input the monitoring code to P0.002 to view changes to the variable on the panel. For the list of monitoring variables, refer to Table 8.3 Monitoring variables descriptions.

Monitoring variables related to EtherCAT communication are as follows.

| Code      | Variable name            | Description  |
|-----------|--------------------------|--|
| 119 (77h) | EtherCAT state machine   | 1: Init<br>2: Pre-Operational (Pre-OP)<br>4: Safe-Operational (Safe-OP)<br>8: Operational (OP)   |
| 120 (78h) | Communication error rate | When this value continues to increase, it indicates that there is communication interference. In an interference-free environment, this value should not increase. (Available on all models except -L) |

## 12.2 Communication function

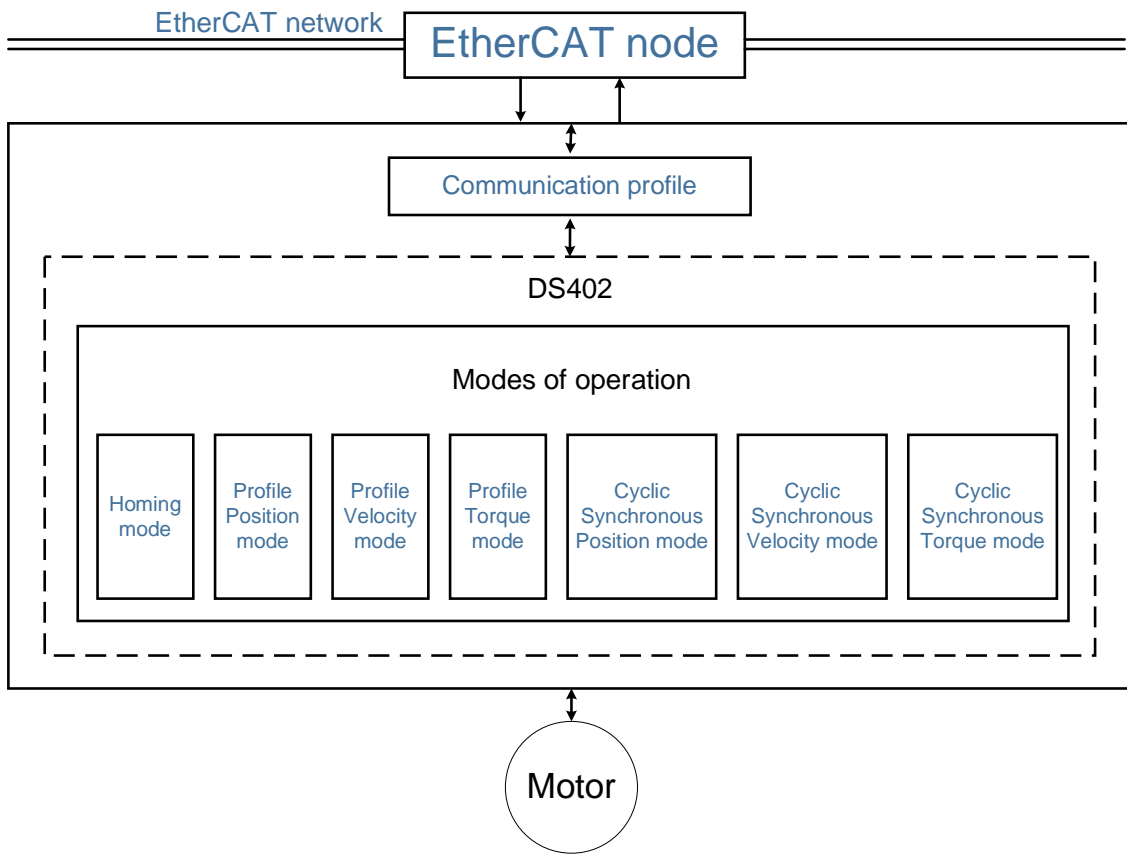

### 12.2.1 Specifications

|                                     |  |  |
|-------------------------------------|--|--|

12

The EtherCAT architecture of the servo drive is as follows:

# 12

- Communication profile: this protocol includes the communication objects (PDO, SDO, SYNC, and Emergency object) and related communication object dictionary.
- DS402 is the device profile for drives and motion control. It defines the behavior of each operation mode and the required object index settings for execution.

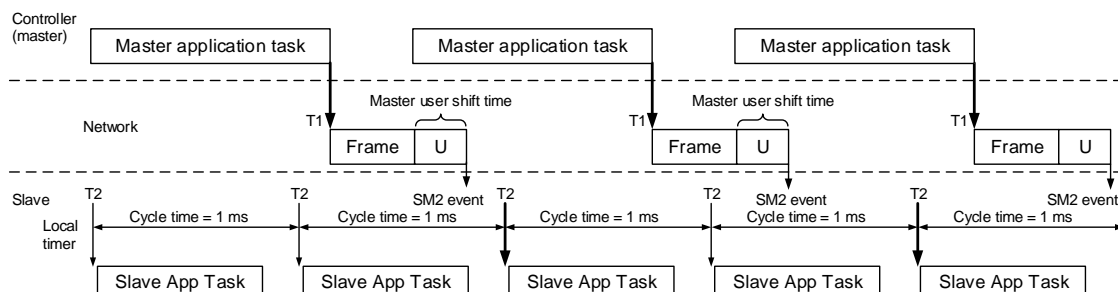

## 12.2.2 Synchronization mode

### 12.2.2.1 Synchronization modes of the servo drive

The servo drive supports two synchronization modes: Free Run mode and DC-Synchronous mode. Note that the Free Run mode is defined as a synchronous mode in the EtherCAT specification established by the EtherCAT Technology Group (ETG).

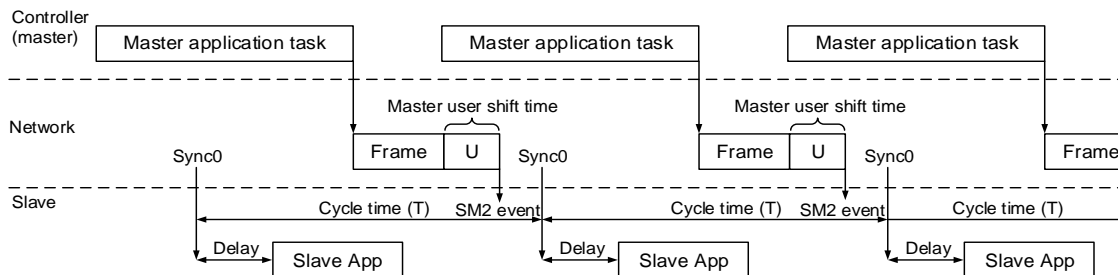

#### Free Run mode (Asynchronous)

Actually, the master and slave(s) run asynchronously in the Free Run mode. The slave clock runs independently of the master clock. That is, the clocks are not synchronized. The command and feedback between the master and slave(s) are transmitted sequentially rather than synchronously. For example, the master sends a PDO at the time T1, and the slave(s) receives the PDO at the time T2 after the SM2 event.

#### DC-Synchronous mode (SYNC0 synchronization)

There is precise time synchronization between the master and slave(s) in the DC-Synchronous mode. The master executes the control program and sends PDO packets at a fixed time cyclically according to the distributed clocks (DC), transmitting the command to and receiving the feedback from the slave(s). The slave(s) receives and updates the PDO data at a fixed time according to the distributed clocks.

Note: Delay = P3.009.Z \* (T/10) (μs)

## 12

### 12.2.2.2 Select Synchronization mode

Follow these steps to select DC-Synchronous or Free Run mode.

1. Select **Drive 3 (ASDA-B3-E CoE Drive)** in the left column of the TwinCAT System Manager window.
2. Under the **DC** tab in the right column, select **DC-Synchronous** or **Free Run** as the Operation Mode.

### 12.2.2.3 Distributed clocks setting

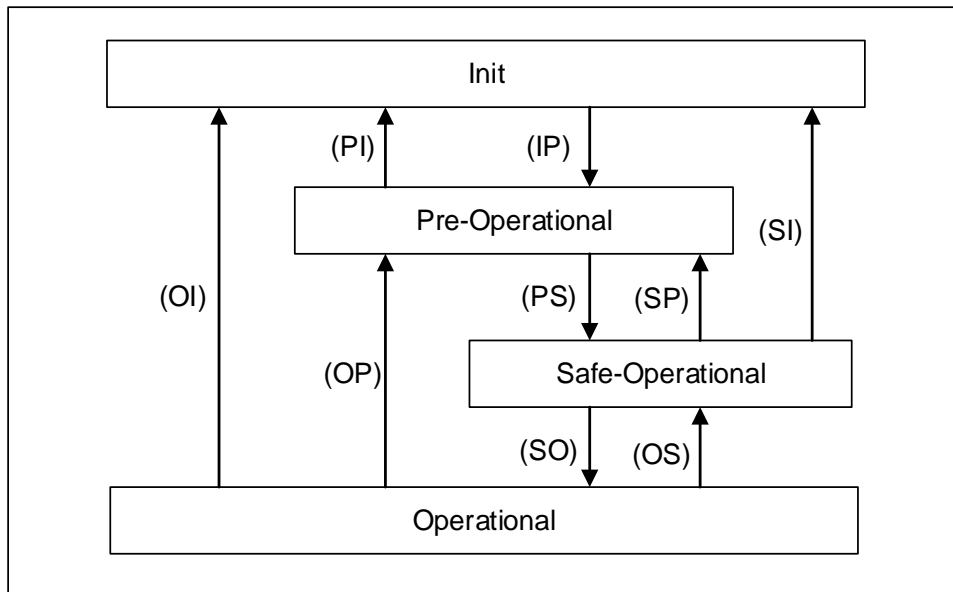

Follow these steps to set the data exchange cycle.

1. Select **NC-Task 1 SAF** in the left column.
2. Set the data exchange cycle in the **Cycle ticks** field under the **Task** tab in the right column.

The SYNC0 cycle is used to define the PDO cycle time. The minimum unit of the SYNC0 cycle for A3-E and B3-E is 125  $\mu$ s. The SYNC0 cycles within 1 ms are 125  $\mu$ s, 250  $\mu$ s, and 500  $\mu$ s in sequence. The SYNC0 cycles above 1 ms are accumulated at intervals of 1 ms, such as 1 ms, 2 ms, 3 ms...10 ms. If the configuration includes an A2-E servo drive, the unit is the minimum unit of A2-E (1 ms).

### 12.2.3 EtherCAT state machine

In EtherCAT communication, the servo drive's state machine can be in the following states. The controller (master) controls the servo (slave) based on the actual state. The controller needs to configure the servo drive according to the designated flow in the following figure. After the controller completes the initialization of the communication, the servo (slave) is in the Operational state and waits for the user's command to perform motion control. Use the monitoring variable P0.002 = 119 to monitor the current state of the EtherCAT state machine.

| Value displayed on the panel when P0.002 = 119 | State                      | Description   |
|--|----------------------------|---|
| 1  | Init                       | The servo drive successfully completes initialization after being powered on without errors occurring. The packets cannot yet be transmitted in this state. |
| 2  | Pre-Operational (Pre-OP)   | Data can be exchanged with SDOs. If an alarm occurs in the servo drive, an emergency message is sent to notify the controller.                              |
| 4  | Safe-Operational (Safe-OP) | The servo drive can use SDO and TxPDO data packets to exchange data with the controller.  |
| 8  | Operational (OP)           | All data exchanges including SDOs and PDOs (TxPDO and RxPDO) are allowed.   |

The controller (master) issues corresponding commands to the servo (slave) according to the state transition.

## 12

| State transition | Description   |
|------------------|---|
| IP               | <ul style="list-style-type: none"> <li>■ The master confirms the VendorID, ProductCode and RevisionNumber of the slave.</li> <li>■ The master calibrates the distributed clocks of the slave (DC-Synchronous mode).</li> <li>■ The master defines the slave address as well as the SyncManager 0 and 1 (SM0 and SM1) register and establishes the mailbox communication.</li> <li>■ The master issues the command and confirms that the slave switches to the Pre-Operational state.</li> </ul> |
| PS               | <ul style="list-style-type: none"> <li>■ The master uses the SDOs to set the PDO mapping and DC related parameters.</li> <li>■ The master defines the FMMU as well as the SyncManager 2 and 3 (SM2 and SM3) registers, and the slave continues to transmit PDO (TxPDO) packets to the master.</li> <li>■ The master issues the command and confirms that the slave switches to the Safe-Operational state.</li> </ul>   |
| SO               | <ul style="list-style-type: none"> <li>■ The master starts transmitting PDOs (RxPDOs).</li> <li>■ The DC synchronization process between the master and slave is started.</li> </ul>  |
| PI, SI, OI       | <ul style="list-style-type: none"> <li>■ The slave disables all communication functions, including the SDOs and PDOs.</li> <li>■ The slave switches to the Init state.</li> </ul>   |
| SP, OP           | <ul style="list-style-type: none"> <li>■ The slave disables the PDO function.</li> <li>■ The slave switches to the Pre-Operational state.</li> </ul>  |
| OS               | <ul style="list-style-type: none"> <li>■ The master stops transmitting PDOs (RxPDOs).</li> <li>■ The slave switches to the Safe-Operational state.</li> </ul>   |

## 12.2.4 PDO mapping configuration

The PDO mapping objects are allocated from OD 1600h to OD 1603h for RxPDOs and OD 1A00h to OD 1A03h for TxPDOs in the object dictionary. Each group of RxPDO and TxPDO supports updating the PDO data for up to 8 sets of 32-bit objects.

### 12.2.4.1 Default PDO mapping configuration

The following tables show the default PDO mapping configuration of the EtherCAT servo drive for data exchange. This is also defined in the XML file of the EtherCAT slave. You can modify the PDO mapping configuration according to the requirements. The fourth group of RxPDO and TxPDO is the suggested configuration for Omron controllers.

In Delta ASDA-x3-E rev0.04.xml, the first to fourth groups of PDO configuration are shown as follows:

First group of RxPDO mapping

|                     |                           |                               |                               |                                       |
|---------------------|---------------------------|-------------------------------|-------------------------------|---------------------------------------|
| RxPDO<br>(OD 1600h) | Controlword<br>(OD 6040h) | Target position<br>(OD 607Ah) | Target velocity<br>(OD 60FFh) | Touch probe<br>function<br>(OD 60B8h) |
|---------------------|---------------------------|-------------------------------|-------------------------------|---------------------------------------|

First group of TxPDO mapping

|                     |   |  |  |                                     |
|---------------------|---|--|--|-------------------------------------|
| TxPDO<br>(OD 1A00h) | Statusword<br>(OD 6041h)                    | Position actual<br>value<br>(OD 6064h) | Velocity actual<br>value<br>(OD 606Ch) | Touch probe<br>status<br>(OD 60B9h) |
|                     | Touch probe pos1<br>pos value<br>(OD 60BAh) | Digital inputs<br>(OD 60FDh)           |  |                                     |

Second group of RxPDO mapping (default)

|                     |                                       |                               |                               |                             |
|---------------------|---------------------------------------|-------------------------------|-------------------------------|-----------------------------|
| RxPDO<br>(OD 1601h) | Controlword<br>(OD 6040h)             | Target position<br>(OD 607Ah) | Target velocity<br>(OD 60FFh) | Target torque<br>(OD 6071h) |
|                     | Touch probe<br>function<br>(OD 60B8h) |                               |                               |                             |

Second group of TxPDO mapping (default)

|                     |                                     |   |  |                                      |
|---------------------|-------------------------------------|---|--|--------------------------------------|
| TxPDO<br>(OD 1A01h) | Statusword<br>(OD 6041h)            | Position actual<br>value<br>(OD 6064h)      | Velocity actual<br>value<br>(OD 606Ch) | Torque actual<br>value<br>(OD 6077h) |
|                     | Touch probe<br>status<br>(OD 60B9h) | Touch probe pos1<br>pos value<br>(OD 60BAh) | Digital inputs<br>(OD 60FDh)           |                                      |

# 12

Third group of RxPDO mapping

|                     |                                  |                                    |                               |                             |
|---------------------|----------------------------------|------------------------------------|-------------------------------|-----------------------------|
| RxPDO<br>(OD 1602h) | Controlword<br>(OD 6040h)        | Target position<br>(OD 607Ah)      | Target velocity<br>(OD 60FFh) | Target torque<br>(OD 6071h) |
|                     | Modes of operation<br>(OD 6060h) | Touch probe function<br>(OD 60B8h) |                               |                             |

Third group of TxPDO mapping

|                     |  |                                     |  |                                   |
|---------------------|--|-------------------------------------|--|-----------------------------------|
| TxPDO<br>(OD 1A02h) | Statusword<br>(OD 6041h)                 | Position actual value<br>(OD 6064h) | Velocity actual value<br>(OD 606Ch)      | Torque actual value<br>(OD 6077h) |
|                     | Modes of operation display<br>(OD 6061h) | Touch probe status<br>(OD 60B9h)    | Touch probe pos1 pos value<br>(OD 60BAh) | Digital inputs<br>(OD 60FDh)      |

Fourth group of RxPDO mapping (for Omron controllers)

|                     |                                  |                                     |                                     |                                    |
|---------------------|----------------------------------|-------------------------------------|-------------------------------------|------------------------------------|
| RxPDO<br>(OD 1603h) | Controlword<br>(OD 6040h)        | Target position<br>(OD 607Ah)       | Target velocity<br>(OD 60FFh)       | Target torque<br>(OD 6071h)        |
|                     | Modes of operation<br>(OD 6060h) | Positive torque limit<br>(OD 60E0h) | Negative torque limit<br>(OD 60E1h) | Touch probe function<br>(OD 60B8h) |

Fourth group of TxPDO mapping (for Omron controllers)

|                     |                                  |  |                                   |  |
|---------------------|----------------------------------|--|-----------------------------------|--|
| TxPDO<br>(OD 1A03h) | Statusword<br>(OD 6041h)         | Position actual value<br>(OD 6064h)      | Torque actual value<br>(OD 6077h) | Modes of operation display<br>(OD 6061h) |
|                     | Touch probe status<br>(OD 60B9h) | Touch probe pos1 pos value<br>(OD 60BAh) | Error code<br>(OD 603Fh)          | Digital inputs<br>(OD 60FDh)             |

### 12.2.4.2 Set PDO mapping

Take the second group of PDO configuration OD 1601h and OD 1A01h as an example, and the settings are as follows:

1. Disable the PDO configuration: set OD 1C12h sub0 to 0 (RxPDO) and OD 1C13h sub0 to 0 (TxPDO).
2. Disable the PDO mapping setting: set OD 1600h sub0 to 0 (RxPDO) and OD 1A01h sub0 to 0 (TxPDO).
3. Set OD 1601h sub1 - sub5 for the RxPDO mapping content, and set OD 1601h sub0 to 5 for the RxPDO mapping number.

| Mapping parameter setting for RxPDO | Data  |     |     | Description  |
|-------------------------------------|-------|-----|-----|--|
| OD 1601h sub1                       | 6040h | 00h | 10h | Controlword (6040h); data length is 16-bit.          |
| OD 1601h sub2                       | 607Ah | 00h | 20h | Target position (607Ah); data length is 32-bit.      |
| OD 1601h sub3                       | 60FFh | 00h | 20h | Target velocity (60FFh); data length is 32-bit.      |
| OD 1601h sub4                       | 6071h | 00h | 10h | Target torque (6071h); data length is 16-bit.        |
| OD 1601h sub5                       | 60B8h | 00h | 10h | Touch probe function (60B8h); data length is 16-bit. |
| OD 1601h sub0                       | 5     |     |     | Set 5 for the RxPDO mapping number.                  |

4. Set OD 1A01h sub1 - sub7 for the TxPDO mapping content, and set OD 1A01h sub0 to 7 for the TxPDO mapping number.

| Mapping parameter setting for TxPDO | Data  |     |     | Description  |
|-------------------------------------|-------|-----|-----|--|
| OD 1A01h sub1                       | 6041h | 00h | 10h | Statusword (6041h); data length is 16-bit.                 |
| OD 1A01h sub2                       | 6064h | 00h | 20h | Position actual value (6064h); data length is 32-bit.      |
| OD 1A01h sub3                       | 606Ch | 00h | 20h | Velocity actual value (606Ch); data length is 32-bit.      |
| OD 1A01h sub4                       | 6077h | 00h | 10h | Torque actual value (6077h); data length is 16-bit.        |
| OD 1A01h sub5                       | 60B9h | 00h | 10h | Touch probe status (60B9h); data length is 16-bit.         |
| OD 1A01h sub6                       | 60BAh | 00h | 20h | Touch probe pos1 pos value (60BAh); data length is 32-bit. |
| OD 1A01h sub7                       | 60FDh | 00h | 20h | Digital inputs (60FDh); data length is 32-bit.             |
| OD 1A01h sub0                       | 7     |     |     | Set 7 for the TxPDO mapping number.                        |

5. Set the PDO mapping configuration: set OD 1C12h sub1 to 0x1601 (RxPDO) and OD 1C13h sub1 to 0x1A01 (TxPDO).
6. Enable the PDO configuration: set OD 1C12h sub0 to 1 (RxPDO) and OD 1C13h sub0 to 1 (TxPDO).

# 12

### 12.2.4.3 PDO mapping object

Real-time data transmission can be achieved with Process data objects (PDOs). There are two types of PDOs: transmit PDOs (TxPDOs) and receive PDOs (RxPDOs). This definition is from the perspective of the servo drive, for example, the TxPDO refers to the object that the servo drive sends to the controller. Set the mapping parameters as shown in the following table to use the PDOs.

| Communication object | Mapping object index | Communication object | Mapping object index |
|----------------------|----------------------|----------------------|----------------------|
| RxPDO1               | 1600h                | TxPDO1               | 1A00h                |
| RxPDO2               | 1601h                | TxPDO2               | 1A01h                |
| RxPDO3               | 1602h                | TxPDO3               | 1A02h                |
| RxPDO4               | 1603h                | TxPDO4               | 1A03h                |

The format of PDO mapping parameter is:

|     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

| Bit             | Function           |
|-----------------|--------------------|
| Bit 0 - Bit 7   | Object data length |
| Bit 8 - Bit 15  | Object sub-index   |
| Bit 16 - Bit 31 | Object index       |

#### 12.2.4.4 SDO abort codes

The abort codes are as follows:

| Abort code | Description  |
|------------|--|
| 05040001h  | Client / server command is invalid or does not exist.  |
| 06010002h  | Attempt to write a read-only object.   |
| 06020000h  | Object does not exist in the object dictionary.  |
| 06040041h  | Unable to map the object to the PDO.   |
| 06040042h  | The number and length of mapped objects exceed the PDO length.   |
| 06060000h  | Access failed due to hardware error (storage or restore error).  |
| 06070010h  | Data type does not match; parameter length does not match.   |
| 06090011h  | Sub-index does not exist.  |
| 06090030h  | The written parameter value is out of range.   |
| 08000000h  | General error.   |
| 080000a1h  | An error occurred when an object is read from EEPROM.  |
| 080000a2h  | An error occurred when an object is written to EEPROM.   |
| 080000a3h  | Invalid range when accessing EEPROM.   |
| 080000a4h  | EEPROM data content error occurred when EEPROM is accessed.  |
| 080000a5h  | The entered password is incorrect when data is written to the encryption area.                                       |
| 08000020h  | Unable to transfer data or save data to the application.   |
| 08000021h  | Unable to transfer data or save data to the application due to restrictions (storage or restore in the wrong state). |
| 08000022h  | Object is in use.  |

# 12

## 12.3 EtherCAT operation modes

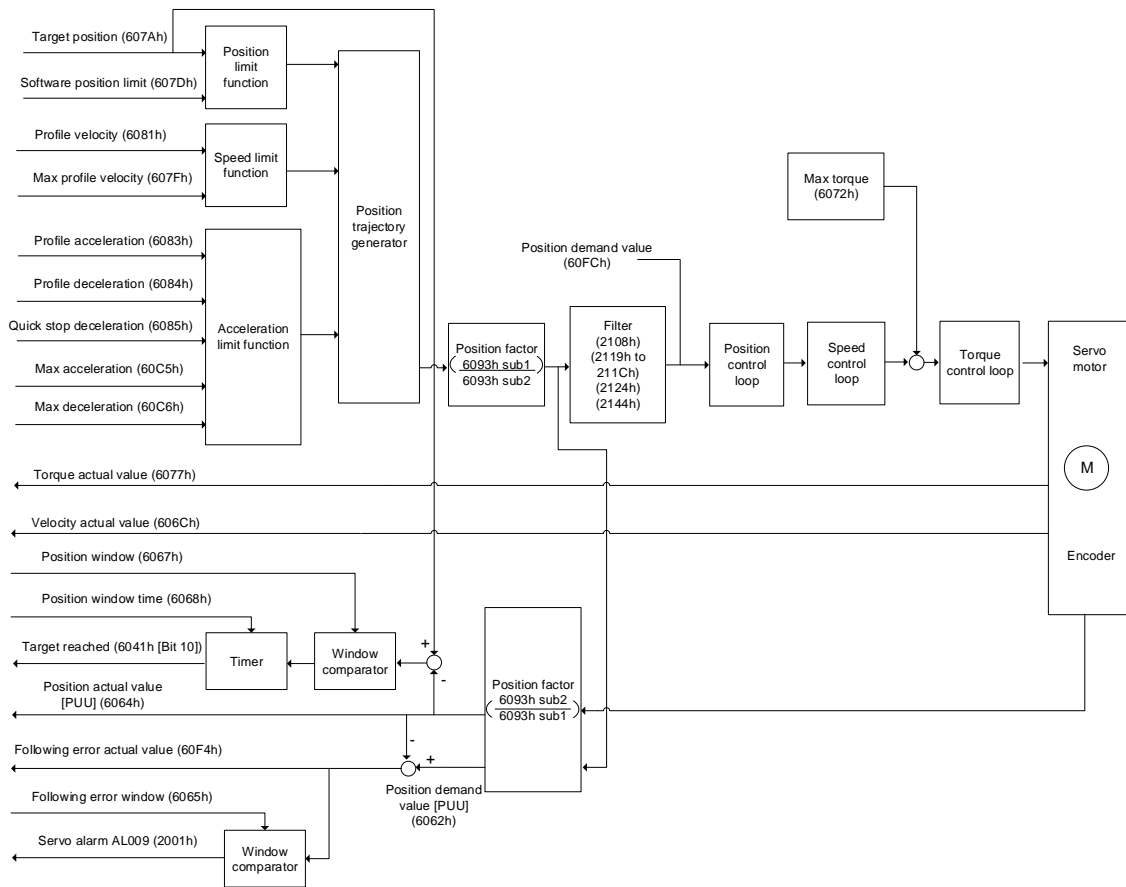

This section describes the modes of operation specified by CiA DS402 when the servo is in the EtherCAT mode. The content includes basic operation settings and related object descriptions.

### 12.3.1 Profile Position mode

After receiving the position command transmitted from the controller, the servo drive controls the servo motor to reach the target position.

In Profile Position (PP) mode, the controller only informs the servo drive of the target position, speed command, and acceleration / deceleration settings at the beginning. The motion planning from command triggering to the arrival of the target position is performed by the trajectory generator in the servo drive.

The following figure shows the Profile Position mode architecture of the servo drive:

Operation steps:

1. Set OD 6060h to 01h to set the mode as Profile Position mode.
2. Set OD 607Ah for the target position (unit: PUU).
3. Set OD 6081h for the profile velocity (unit: PUU/sec).
4. Set OD 6083h for the profile acceleration (unit: ms).
5. Set OD 6084h for the profile deceleration (unit: ms).
6. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 6.1 and 6.2 are to bring the servo drive's state machine into the ready state. For the description of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                                |
|------|-------|-------|-------|-------|-------|--|
| 6.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                                  |
| 6.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On).            |
| 6.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).               |
| 6.4  | 1     | 1     | 1     | 1     | 1     | Command triggering (rising-edge triggered) |

7. After the servo completes the first motion command, the servo sets the target position, speed, and other conditions to execute the next motion command.
8. Set the Controlword (OD 6040h). Since the command is rising-edge triggered, switch Bit 4 to Off first and then to On.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                                |
|------|-------|-------|-------|-------|-------|--|
| 8.1  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).               |
| 8.2  | 1     | 1     | 1     | 1     | 1     | Command triggering (rising-edge triggered) |

Read the servo drive information:

1. Read OD 6064h to obtain the actual value of the motor position at present.
2. Read OD 6041h to obtain the servo drive status, including the following error and notifications for set-point acknowledge and target reached.

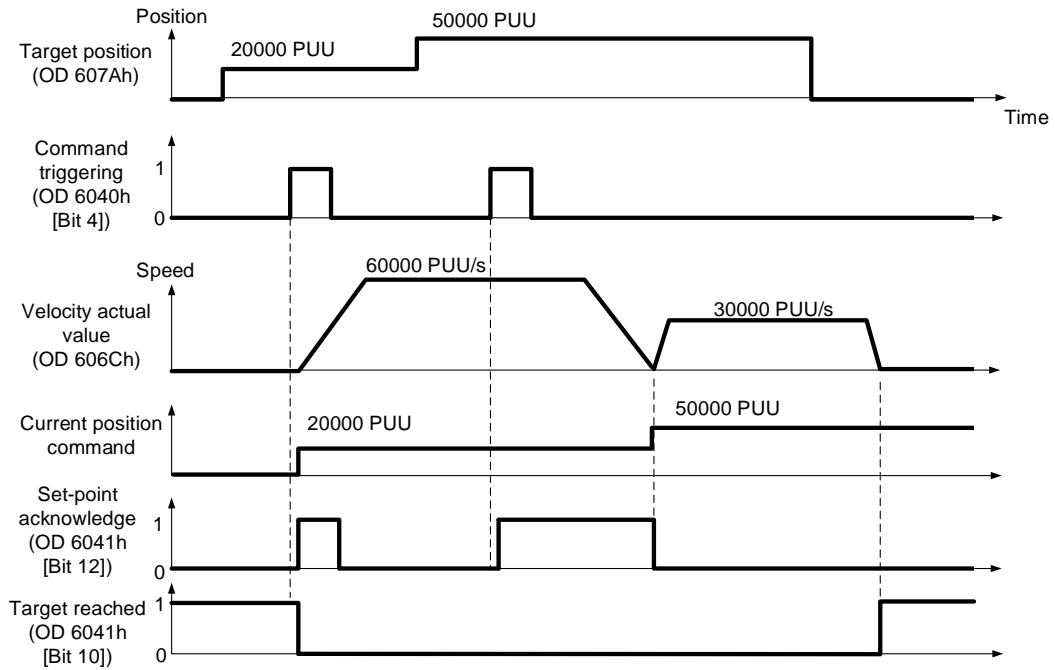

### Function for the command to take immediate effect

In Profile Position mode, set the command to take effect immediately or not with OD 6040h [Bit 5].

# 12

- Set OD 6040h [Bit 5] to 0 to disable the command from taking immediate effect

If the command is not enabled to take immediate effect, when the current motion command is in execution (not yet complete), the servo continues to execute the current motion command even if a new command is triggered. The new command is acknowledged and executed only after the current command is complete.

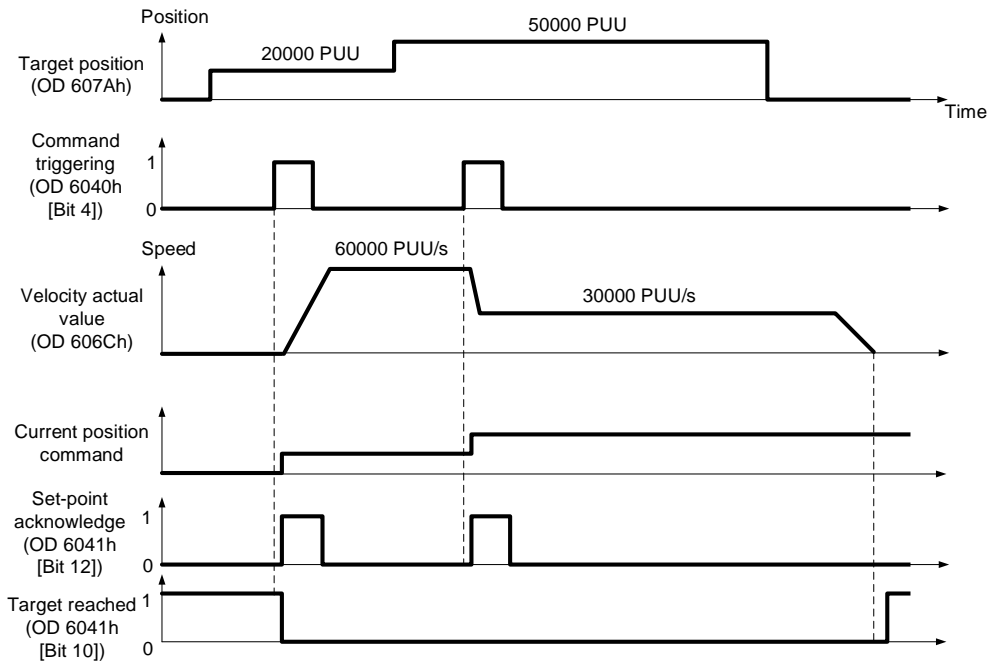

- Set OD 6040h [Bit 5] to 1 to enable the command to take immediate effect is enabled (only valid in Profile Position mode).

If the command is enabled to take immediate effect, when the current motion command is in execution (not yet complete), the servo immediately interrupts the current command and executes the new command once receiving the new triggered command.

Note: for more details, refer to Section 12.4.3 Details of objects.

# 12

### 12.3.2 Profile Velocity mode

In Profile Velocity (PV) mode, the controller specifies the speed command and acceleration / deceleration conditions, and then the trajectory generator of the servo drive plans the motion path according to these conditions.

Operation steps:

1. Set OD 6060h to 03h to set the mode as Profile Velocity mode.
2. Set OD 6083h for the profile acceleration.
3. Set OD 6084h for the profile deceleration.
4. Set the target velocity (OD 60FFh) to 0. In Profile Velocity mode, the servo motor starts operating once the servo drive is switched to Servo On (Step 5). Therefore, setting the target velocity (OD 60FFh) to 0 is to ensure that the motor maintains at 0 rpm at the moment of Servo On.
5. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 5.1 and 5.2 are to bring the servo drive's state machine into the ready state. For more details of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 5.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 5.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 5.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |

6. Set OD 60FFh for the target velocity.

Read the servo drive information:

1. Read OD 6041h to obtain the servo drive status.
2. Read OD 606Ch to obtain the current velocity actual value.

| 607Fh | Max profile velocity        | UNSIGNED32 | RW     |
| 6083h | Profile acceleration        | UNSIGNED32 | RW     |
| 6084h | Profile deceleration        | UNSIGNED32 | RW     |
| 6085h | Quick stop deceleration     | UNSIGNED32 | RW     |
| 6093h | Position factor             | UNSIGNED32 | RW     |
| 60C5h | Max acceleration            | UNSIGNED32 | RW     |
| 60C6h | Max deceleration            | UNSIGNED32 | RW     |
| 60E0h | Positive torque limit       | UNSIGNED16 | RW     |
| 60E1h | Negative torque limit       | UNSIGNED16 | RW     |
| 60FFh | Target velocity             | INTEGER32  | RW     |

Note: for more details, refer to Section 12.4.3 Details of objects.

### 12.3.3 Profile Torque mode

In Profile Torque (PT) mode, the controller specifies the torque command and filtering conditions, and then the trajectory generator of the servo drive plans the torque slope according to these conditions.

Operation steps:

1. Set OD 6060h to 04h to set the mode as Profile Torque mode.
2. Set OD 6087h for the torque slope.
3. Set the target torque (OD 6071h) to 0. In Profile Torque mode, the servo target torque takes effect once the servo drive is switched to Servo On (Step 4). Therefore, set the target torque (OD 6071h) to 0 for safety reasons.
4. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 4.1 and 4.2 are to bring the servo drive's state machine into the ready state. For more details of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 4.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 4.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 4.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |

5. Set OD 6071h for the target torque.

Read the servo drive information:

1. Read OD 6041h to obtain the servo drive status.
2. Read OD 6077h to obtain the current torque actual value.

| 6087h | Torque slope                | UNSIGNED32 | RW     |
| 6093h | Position factor             | UNSIGNED32 | RW     |

Note: for more details, refer to Section 12.4.3 Details of objects.

### 12.3.4 Homing mode

After homing is complete, the position system of the servo drive is established and the drive can start executing the position command issued by the controller. The Delta servo drive offers 39 homing methods, including homing on the home switch, positive or negative limit, motor Z pulse, and hard stop.

Operation steps:

1. Set OD 6060h to 06h to set the mode as Homing mode.
2. Set OD 607Ch for the home offset.
3. Set OD 6098h for the homing method.
4. Set OD 6099h sub1 for the speed when searching for the home switch.
5. Set OD 6099h sub2 for the speed when searching for the Z pulse.
6. Set OD 609Ah for the homing acceleration.
7. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 7.1 and 7.2 are to bring the servo drive's state machine into the ready state. For more details of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 7.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 7.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 7.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |
| 7.4  | 1     | 1     | 1     | 1     | 1     | Homing (rising-edge triggered). |

Read the servo drive information:

1. Read OD 6041h to obtain the servo drive status.
2. Read OD 6064h to obtain the actual value of the motor position at present.

# 12

Relevant object list

| 6098h | Homing method               | INTEGER8   | RW     |
| 6099h | Homing speeds               | UNSIGNED32 | RW     |
| 609Ah | Homing acceleration         | UNSIGNED32 | RW     |
| 60C5h | Max acceleration            | UNSIGNED32 | RW     |
| 60C6h | Max deceleration            | UNSIGNED32 | RW     |

Note: for more details, refer to Section 12.4.3 Details of objects.

### 12.3.5 Cyclic Synchronous Position mode

The controller plans the path in Cyclic Synchronous Position (CSP) mode and transmits PDOs to the servo drive periodically. In this mode, when the controller transmits each PDO, it simultaneously transmits the target position and controlword data to the servo drive. The velocity offset and torque offset can be used as the velocity and torque feed forward control setting.

Operation steps:

1. Set OD 6060h to 08h to set the mode as Cyclic Synchronous Position mode.
2. Set OD 607Ah for the target position (unit: PUU).
3. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 3.1 and 3.2 are to bring the servo drive's state machine into the ready state. For the description of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 3.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 3.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 3.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |

Note: for more details, refer to Section 12.4.3 Details of objects.

### 12.3.6 Cyclic Synchronous Velocity mode

The controller plans the speed in Cyclic Synchronous Velocity (CSV) mode and transmits PDOs to the servo drive periodically. In this mode, when the controller transmits each PDO, it simultaneously transmits the target velocity and controlword data to the servo drive. The velocity offset and torque offset can be used as the velocity and torque feed forward control setting.

Operation steps:

1. Set OD 6060h to 09h to set the mode as Cyclic Synchronous Velocity mode.
2. Set the target velocity (OD 60FFh) to 0. In Cyclic Synchronous Velocity mode, the servo motor starts operating once the servo drive is switched to Servo On (Step 3). Therefore, setting the target velocity (OD 60FFh) to 0 is to ensure that the motor maintains at 0 rpm at the moment of Servo On.
3. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 3.1 and 3.2 are to bring the servo drive's state machine into the ready state. For the description of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 3.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 3.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 3.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |

4. Set OD 60FFh for the target velocity.

### 12.3.7 Cyclic Synchronous Torque mode

The controller plans the torque in Cyclic Synchronous Torque (CST) mode and transmits PDOs to the servo drive periodically. In this mode, when the controller transmits each PDO, it simultaneously transmits the target torque and controlword data to the servo drive. The torque offset can be used as the torque feed forward control setting.

Operation steps:

1. Set OD 6060h to 0Ah to set the mode as Cyclic Synchronous Torque mode.
2. Set the target torque (OD 6071h) to 0. In Cyclic Synchronous Torque mode, the servo target torque takes effect once the servo drive is switched to Servo On (Step 3). Therefore, set the target torque (OD 6071h) to 0 for safety reasons.
3. Set the Controlword (OD 6040h). Follow these steps for operation. Steps 3.1 and 3.2 are to bring the servo drive's state machine into the ready state. For more details of the state machine, refer to the OD 6040h description in Section 12.4.3.3.

| Step | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                     |
|------|-------|-------|-------|-------|-------|---------------------------------|
| 3.1  | 0     | 0     | 1     | 1     | 0     | Shutdown.                       |
| 3.2  | 0     | 0     | 1     | 1     | 1     | Switch on (ready for Servo On). |
| 3.3  | 0     | 1     | 1     | 1     | 1     | Enable operation (Servo On).    |

4. Set OD 6071h for the target torque.

### 12.3.8 Touch Probe function and Touch Probe status

The Touch Probe function can be triggered by high-speed digital inputs (only DI1 and DI2) or by the motor Z pulse. This function is used for high-speed measurement or packaging applications.

If the capture source is the motor Z pulse or DI of CN1, note the following:

1. When the capture source is set to the motor Z pulse, you can only use Touch Probe 1. Regardless of the settings of OD 60B8h [Bit 4] and [Bit 5], the command is rising-edge triggered and the data is stored in OD 60BAh.
2. When the capture source is set to the DI of CN1, the previously set function code for the DI is changed to 0x0100 so one DI does not have two functions.

Set the Touch Probe function with OD 60B8h. The definition of each bit is as follows.

|     |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| Bit           | Function                                     | Description   |
|---------------|--|---|
| Bit 0         | Touch Probe 1 switch                         | 0: disable Touch Probe 1.<br>1: enable Touch Probe 1.   |
| Bit 1         | Touch Probe 1 number of capturing times      | 0: capture one time. If the Touch Probe 1 signal is set to be both rising-edge and falling-edge triggered, the data is captured once for each triggering.<br>1: capture multiple times. |
| Bit 2         | Touch Probe 1 capture source                 | 0: DI1 of CN1<br>1: motor Z pulse   |
| Bit 3         | Reserved                                     | -   |
| Bit 4         | Rising-edge trigger action of Touch Probe 1  | 0: N/A<br>1: start capturing when the Touch Probe 1 signal is rising-edge triggered and store the data in OD 60BAh.   |
| Bit 5         | Falling-edge trigger action of Touch Probe 1 | 0: N/A<br>1: start capturing when the Touch Probe 1 signal is falling-edge triggered and store the data in OD 60BBh.  |
| Bit 6 - Bit 7 | Reserved                                     | -   |
| Bit 8         | Touch Probe 2 switch                         | 0: disable Touch Probe 2.<br>1: enable Touch Probe 2.   |
| Bit 9         | Touch Probe 2 number of capturing times      | 0: capture one time. If the Touch Probe 2 signal is set to be both rising-edge and falling-edge triggered, the data is captured once for each triggering.<br>1: capture multiple times. |
| Bit 10        | Touch Probe 2 capture source                 | 0: DI2 of CN1   |
| Bit 11        | Reserved                                     | -   |
| Bit 12        | Rising-edge trigger action of Touch Probe 2  | 0: N/A<br>1: start capturing when the Touch Probe 2 signal is rising-edge triggered and store the data in OD 60BCh.   |

# 12

| Bit             | Function                                     | Description  |
|-----------------|--|--|
| Bit 13          | Falling-edge trigger action of Touch Probe 2 | 0: N/A<br>1: start capturing when the Touch Probe 2 signal is falling-edge triggered and store the data in OD 60BDh. |
| Bit 14 - Bit 15 | Reserved                                     | -  |

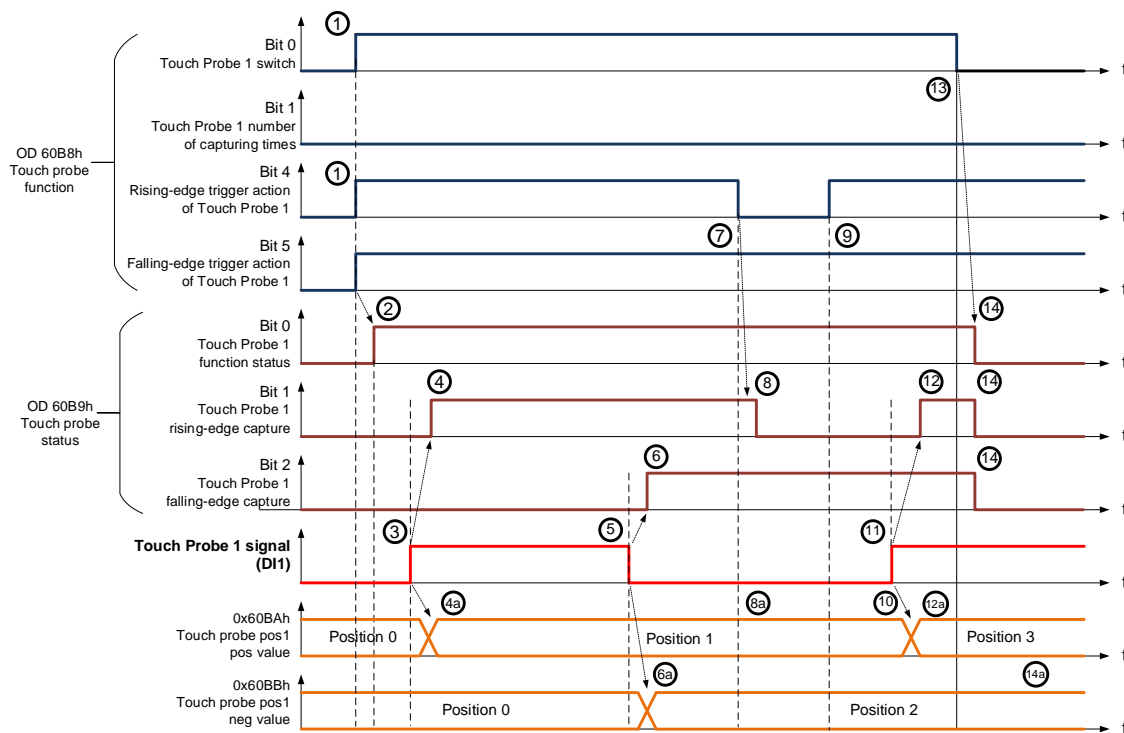

You can access the Touch Probe status with OD 60B9h. The definition of each bit is as follows.

|     |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| Bit             | Function   | Description  |
|-----------------|--|--|
| Bit 0           | Touch Probe 1 function status  | 0: Touch Probe 1 disabled.<br>1: Touch Probe 1 enabled.  |
| Bit 1           | Touch Probe 1 rising-edge capture  | 0: capturing is not triggered.<br>1: the Touch Probe 1 signal is rising-edge triggered and the data is successfully captured.  |
| Bit 2           | Touch Probe 1 falling-edge capture   | 0: capturing is not triggered.<br>1: the Touch Probe 1 signal is falling-edge triggered and the data is successfully captured. |
| Bit 3 - Bit 5   | Reserved   | -  |
| Bit 6           | Touch Probe 1 capture source   | 0: DI1 of CN1<br>1: motor Z pulse  |
| Bit 7           | Touch Probe 1 signal for capturing multiple times (Available when the function of OD 60B8h [Bit 1] Number of capturing times is enabled) | The status is reversed once the capturing succeeds. Refer to the timing diagram in Example 3.                                  |
| Bit 8           | Touch Probe 2 function status  | 0: Touch Probe 2 disabled.<br>1: Touch Probe 2 enabled.  |
| Bit 9           | Touch Probe 2 rising-edge capture  | 0: capturing is not triggered<br>1: the Touch Probe 2 signal is rising-edge triggered and the data is successfully captured.   |
| Bit 10          | Touch Probe 2 falling-edge capture   | 0: capturing is not triggered<br>1: the Touch Probe 2 signal is falling-edge triggered and the data is successfully captured.  |
| Bit 11 - Bit 13 | Reserved   | -  |
| Bit 14          | Touch Probe 2 capture source   | 0: DI2 of CN1  |
| Bit 15          | Touch Probe 2 signal for capturing multiple times (Available when the function of OD 60B8h [Bit 9] Number of capturing times is enabled) | The status is reversed once the capturing succeeds.  |

Example 1: the following is the timing diagram for the Touch Probe 1 function. In this example, the Touch Probe 1 function is triggered by the external DI. When OD 60B8h [Bit 1] is set to 0 and OD 60B8h [Bit 4] & [Bit 5] are set to 1, the Touch Probe 1 signal is both rising-edge and falling-edge triggered, and the data is captured once for each triggering.

| Status | Function             | Description   |
|--------|----------------------|---|
| (1)    | OD 60B8h [Bit 0] = 1 | Enable Touch Probe 1.   |
|        | OD 60B8h [Bit 1] = 0 | Capture one time.   |
|        | OD 60B8h [Bit 4] = 1 | Start capturing when the Touch Probe 1 signal is rising-edge triggered.                                   |
|        | OD 60B8h [Bit 5] = 1 | Start capturing when the Touch Probe 1 signal is falling-edge triggered.                                  |
| (2)    | OD 60B9h [Bit 0] = 1 | Touch Probe status: Touch Probe 1 function enabled.   |
| (3)    | -                    | Touch Probe 1 is rising-edge triggered by external signal.  |
| (4)    | OD 60B9h [Bit 1] = 1 | Touch Probe status: Touch Probe 1 is rising-edge triggered and the data is successfully captured.         |
| (4a)   | OD 60BAh             | Store the captured data in OD 60BAh when the Touch Probe 1 signal is rising-edge triggered.               |
| (5)    | -                    | Touch Probe 1 is falling-edge triggered by external signal.   |
| (6)    | OD 60B9h [Bit 2] = 1 | Touch Probe status: Touch Probe 1 signal is falling-edge triggered and the data is successfully captured. |
| (6a)   | OD 60BBh             | Store the captured data in OD 60BBh when the Touch Probe 1 signal is falling-edge triggered.              |
| (7)    | OD 60B8h [Bit 4] = 0 | Disable the rising-edge trigger action of Touch Probe 1.  |
| (8)    | OD 60B9h [Bit 1] = 0 | Touch Probe status: reset the rising-edge capture status to non-triggered.                                |
| (8a)   | OD 60BAh             | Data at the rising-edge remains the same.   |
| (9)    | OD 60B8h [Bit 4] = 1 | Start capturing when the Touch Probe 1 signal is rising-edge triggered.                                   |

# 12

| Status | Function   | Description  |
|--------|--|--|
| (10)   | OD 60BAh   | Data at the rising-edge remains the same.  |
| (11)   | -  | Touch Probe 1 is rising-edge triggered by external signal.   |
| (12)   | OD 60B9h [Bit 1] = 1   | Touch Probe status: Touch Probe 1 signal is rising-edge triggered and the data is successfully captured. |
| (12a)  | OD 60BAh   | Store the captured data in OD 60BAh when the Touch Probe 1 signal is rising-edge triggered.              |
| (13)   | OD 60B8h [Bit 0] = 0   | Disable Touch Probe 1.   |
| (14)   | OD 60B9h [Bit 0] = 0<br>OD 60B9h [Bit 1] = 0<br>OD 60B9h [Bit 2] = 0 | Reset Touch Probe 1 status.  |
| (14a)  | OD 60BAh   | The previously captured data remains the same.   |

Example 2: the following is the timing diagram for the Touch Probe 1 function. In this example, the Touch Probe 1 function is triggered by the motor Z pulse. The data is captured only once when the Touch Probe 1 signal is rising-edge triggered.

Example 3: the following is the timing diagram for the Touch Probe 1 function. In this example, the Touch Probe 1 function is triggered by the motor Z pulse. The data is captured **multiple times** when the Touch Probe 1 signal is rising-edge triggered.

## 12

## 12.4 Object dictionary

This section details the EtherCAT objects supported by the servo. The contents include object index, name, data type, data length, and read / write permissions (access).

### 12.4.1 Specifications for objects

#### Object code

| Object code | Description  |
|-------------|--|
| VAR         | A single value, such as an UNSIGNED8, Boolean, float, and INTEGER16.   |
| ARRAY       | An object of multiple data fields consisting of multiple variables of the same data type, such as an UNSIGNED16 array. The sub-index 0 data type is UNSIGNED8, so it is not an ARRAY data. |
| RECORD      | An object of multiple data fields consisting of multiple variables of different data types. The sub-index 0 data type is UNSIGNED8, so it is not a RECORD data.                            |

#### Data type

Refer to CANopen DS301.

## 12.4.2 List of objects

### OD 1XXXh communication object group

| Index         | Object code | Name                           | Data type  | Access |
|---------------|-------------|--------------------------------|------------|--------|
| 1000h         | VAR         | Device type                    | UNSIGNED32 | RO     |

## 12.4.3 Details of objects

### 12.4.3.1 OD 1XXXh communication object group

Object 1000h: Device type

|               |             |
|---------------|-------------|
| Index         | 1000h       |
| Name          | Device type |
| Object code   | VAR         |
| Data type     | UNSIGNED32  |
| Access        | RO          |
| PDO mapping   | No          |
| Setting range | UNSIGNED32  |

Format of this object: (High word h) DCBA; (Low word L) UZYX

|   |                               |   |   |
|---|-------------------------------|---|---|
| A | Bit 16 - Bit 31<br>Model type | X | Bit 0 - Bit 15<br>Device profile number |
| B |                               | Y |   |
| C |                               | Z |   |
| D |                               | U |   |

Definitions are as follows:

- UZYX: device profile number (servo drive: 0192)
- DCBA: model type

| DCBA | Model type |
|------|------------|
| 0402 | A2         |
| 0602 | M          |
| 0702 | A3         |
| 0B02 | B3         |
| 1002 | E3         |

Object 1001h: Error register

|               |                |
|---------------|----------------|
| Index         | 1001h          |
| Name          | Error register |
| Object code   | VAR            |
| Data type     | UNSIGNED8      |
| Access        | RO             |
| PDO mapping   | Yes            |
| Setting range | UNSIGNED8      |
| Default       | 0              |

Object function:

The bits and corresponding functions are as follows:

# 12

| Bit           | Function            |
|---------------|---------------------|
| Bit 0         | Generic error       |
| Bit 1         | Current             |
| Bit 2         | Voltage             |
| Bit 3         | Temperature         |
| Bit 4         | Communication error |
| Bit 5 - Bit 7 | Reserved            |

Object 1003h: Pre-defined error field

|             |                         |
|-------------|-------------------------|
| Index       | 1003h                   |
| Name        | Pre-defined error field |
| Object code | ARRAY                   |
| Data type   | UNSIGNED32              |
| Access      | RW                      |
| PDO mapping | No                      |

|               |                  |
|---------------|------------------|
| Sub-index     | 0                |
| Description   | Number of errors |
| Data type     | UNSIGNED8        |
| Access        | RW               |
| PDO mapping   | No               |
| Setting range | 0 - 5            |
| Default       | 0                |

|               |                      |
|---------------|----------------------|
| Sub-index     | 1 - 5                |
| Description   | Standard error field |
| Data type     | UNSIGNED32           |
| Access        | RO                   |
| PDO mapping   | No                   |
| Setting range | UNSIGNED32           |
| Default       | 0                    |

Format of this object: (High word h) DCBA; (Low word L) UZYX

|   |                                      |   |                              |
|---|--------------------------------------|---|------------------------------|
| A | Bit 16 - Bit 31<br>Delta servo alarm | X | Bit 0 - Bit 15<br>Error code |
| B |                                      | Y |                              |
| C |                                      | Z |                              |
| D |                                      | U |                              |

Definitions are as follows:

- UZYX: error code. Refer to the error code definition in DS402.
- DCBA: Delta servo alarm. Refer to Chapter 14 Troubleshooting.

Example:

When you operate the servo, if the encoder cable is not correctly connected, the servo drive panel displays AL011 and its error code is stored in the OD 1003h array. The display is as follows:

| Byte: | High word                  | Low word            |
|-------|----------------------------|---------------------|
|       | Delta servo alarm (UINT16) | Error code (UINT16) |
|       | 0x0011                     | 0x7305              |

AL011 is defined as “CN2 communication failed” based on the Delta servo alarm.

Error code: 0x7305 is defined as “Incremental sensor 1 fault” according to DS402.

Object 1006h: Communication cycle period

|               |                            |
|---------------|----------------------------|
| Index         | 1006h                      |
| Name          | Communication cycle period |
| Object code   | VAR                        |
| Data type     | UNSIGNED32                 |
| Access        | RW                         |
| PDO mapping   | No                         |
| Setting range | UNSIGNED32                 |
| Default       | 0                          |
| Unit          | µs                         |

Object function:

This object is to set the communication cycle, which is the interval between two SYNCs. If you are not using SYNC, set this object to 0.

# 12

Objects 1600h - 1603h: Receive PDO mapping parameter

|             |  |
|-------------|--|
| Index       | 1600h, 1601h, 1602h, 1603h   |
| Name        | Receive PDO mapping parameter  |
| Object code | RECORD   |
| Data type   | PDO mapping  |
| Access      | RW   |
| Note        | The total length of objects in a group of PDO cannot exceed 64 bits. |

|               |  |
|---------------|--|
| Sub-index     | 0  |
| Description   | Number of PDO mappings   |
| Data type     | UNSIGNED8  |
| Access        | RW   |
| PDO mapping   | No   |
| Setting range | 0: disable<br>1 - 8: set the number of PDO mapping and enable the function |
| Default       | 0  |

|               |   |
|---------------|---|
| Sub-index     | 1 - 8   |
| Description   | Specify the 1 <sup>st</sup> (to 8 <sup>th</sup> ) object and its content to be mapped |
| Data type     | UNSIGNED32  |
| Access        | RW  |
| PDO mapping   | No  |
| Setting range | UNSIGNED32  |
| Default       | 0   |

The format of this object is as follows:

| Bit             | Function           |
|-----------------|--------------------|
| Bit 0 - Bit 7   | Object data length |
| Bit 8 - Bit 15  | Object sub-index   |
| Bit 16 - Bit 31 | Object index       |

Example:

To set the three PDOs, OD 6040h, OD 607Ah, and OD 6060h, in the first group of PDO, the setting is as follows.

| Mapping parameter setting for RxPDO | Data  |     |     | Description   |
|-------------------------------------|---|-----|-----|---|
| OD 1600h sub0                       | 3   |     |     | Set 3 PDO mappings.   |
| OD 1600h sub1                       | 6040h   | 00h | 10h | Mapping the Controlword (OD 6040h); data length is 16-bit     |
| OD 1600h sub2                       | 607Ah   | 00h | 20h | Mapping the target position (OD 607Ah); data length is 32-bit |
| OD 1600h sub3                       | 6060h   | 00h | 08h | Mapping the operation mode (OD 6060h); data length is 8-bit   |
| Note                                | The total length is 38h (56-bit) which meets the specification of less than 64-bit. |     |     |   |

12

Objects 1A00h - 1A03h: Transmit PDO mapping parameter

|             |  |
|-------------|--|
| Index       | 1A00h, 1A01h, 1A02h, 1A03h   |
| Name        | Transmit PDO mapping parameter                                       |
| Object code | RECORD   |
| Data type   | PDO mapping  |
| Access      | RW   |
| Note        | The total length of objects in a group of PDO cannot exceed 64 bits. |

|               |  |
|---------------|--|
| Sub-index     | 0  |
| Description   | Number of PDO mappings   |
| Data type     | UNSIGNED8  |
| Access        | RW   |
| PDO mapping   | No   |
| Setting range | 0: disable<br>1 - 8: set the number of PDO mapping and enable the function |
| Default       | 0  |

|               |   |
|---------------|---|
| Sub-index     | 1 - 8   |
| Description   | Specify the 1 <sup>st</sup> (to 8 <sup>th</sup> ) object and its content to be mapped |
| Data type     | UNSIGNED32  |
| Access        | RW  |
| PDO mapping   | No  |
| Setting range | UNSIGNED32  |
| Default       | 0   |

Format of this object: (High word h) DCBA; (Low word L) UZYX

|      |                                 |    |                                     |
|------|---------------------------------|----|-------------------------------------|
| DCBA | Bit 16 - Bit 31<br>Object index | YX | Bit 0 - Bit 7<br>Object data length |
|      |                                 | UZ | Bit 8 - Bit 15<br>Object sub-index  |

## 12

## Object 1C12h: RxPDO assign

|             |              |
|-------------|--------------|
| Index       | 1C12h        |
| Name        | RxPDO assign |
| Object code | ARRAY        |
| Data type   | UNSIGNED16   |
| Access      | RW           |
| PDO mapping | No           |

|               |                     |
|---------------|---------------------|
| Sub-index     | 0                   |
| Description   | Number of sub-index |
| Data type     | UNSIGNED8           |
| Access        | RW                  |
| PDO mapping   | No                  |
| Setting range | 0 - 1               |
| Default       | 1                   |

|               |                                    |
|---------------|------------------------------------|
| Sub-index     | 0                                  |
| Description   | Specify the RxPDO index to be used |
| Data type     | UNSIGNED16                         |
| Access        | RW                                 |
| PDO mapping   | No                                 |
| Setting range | 0x1600, 0x1601, 0x1602, 0x1603     |
| Default       | 0x1601                             |

## Object 1C13h: TxPDO assign

|             |              |
|-------------|--------------|
| Index       | 1C13h        |
| Name        | TxPDO assign |
| Object code | ARRAY        |
| Data type   | UNSIGNED16   |
| Access      | RW           |

|               |                     |
|---------------|---------------------|
| Sub-index     | 0                   |
| Description   | Number of sub-index |
| Data type     | UNSIGNED8           |
| Access        | RW                  |
| PDO mapping   | No                  |
| Setting range | 0 - 1               |
| Default       | 1                   |

|               |                                    |
|---------------|------------------------------------|
| Sub-index     | 0                                  |
| Description   | Specify the TxPDO index to be used |
| Data type     | UNSIGNED16                         |
| Access        | RW                                 |
| PDO mapping   | No                                 |
| Setting range | 0x1A00, 0x1A01, 0x1A02, 0x1A03     |
| Default       | 0x1A01                             |

### 12.4.3.2 OD 2XXXh servo parameter group

Object 2XXXh: Parameter mapping

|               |                       |
|---------------|-----------------------|
| Index         | 2XXXh                 |
| Name          | Parameter mapping     |
| Object code   | VAR                   |
| Data type     | INTEGER16 / INTEGER32 |
| Access        | RW                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER16 / INTEGER32 |
| Default       | N/A                   |

# 12

Object function:

Access the corresponding servo parameters with the OD 2XXXh group. The conversion between the parameter number and object index is as follows:

| Object index | Servo parameter | Description                              |
|--------------|-----------------|--|
| 2aBCh        | Pa.bcd          | "BC" is the hexadecimal format of "bcd". |

You can read the object index first to get the information of the parameter length, and then use SDO or PDO to change the data.

Example 1:

Object 2300h: Node-ID [P3.000]

|               |           |
|---------------|-----------|
| Index         | 2300h     |
| Name          | Node-ID   |
| Object code   | VAR       |
| Data type     | INTEGER16 |
| Access        | RW        |
| PDO mapping   | Yes       |
| Setting range | INTEGER16 |
| Default       | 7F        |

Example 2:

Object 212Ch: Electronic gear [P1.044]

|               |                 |
|---------------|-----------------|
| Index         | 212Ch           |
| Name          | Electronic gear |
| Object code   | VAR             |
| Data type     | INTEGER32       |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | INTEGER32       |
| Default       | 1               |

# 12

### 12.4.3.3 OD 6XXXh communication object group

Object 603Fh: Error code (CANopen defined)

|               |            |
|---------------|------------|
| Index         | 603Fh      |
| Name          | Error code |
| Object code   | VAR        |
| Data type     | UNSIGNED16 |
| Access        | RO         |
| PDO mapping   | Yes        |
| Setting range | UNSIGNED16 |
| Default       | 0          |

Object 6040h: Controlword

|               |             |
|---------------|-------------|
| Index         | 6040h       |
| Name          | Controlword |
| Object code   | VAR         |
| Data type     | UNSIGNED16  |
| Access        | RW          |
| PDO mapping   | Yes         |
| Setting range | UNSIGNED16  |
| Default       | 0x0004      |

Object function:

The Controlword contains many functions, such as Servo On, command triggering, fault reset, and quick stop. The state machine architecture is as follows:

|     |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| Bit   | Function                    | Description         |
|-------|-----------------------------|---------------------|
| Bit 0 | Switch on                   | Ready for Servo On. |
| Bit 1 | Enable voltage              | -                   |
| Bit 2 | Quick stop (B contact (NC)) | -                   |
| Bit 3 | Enable operation            | Servo On.           |

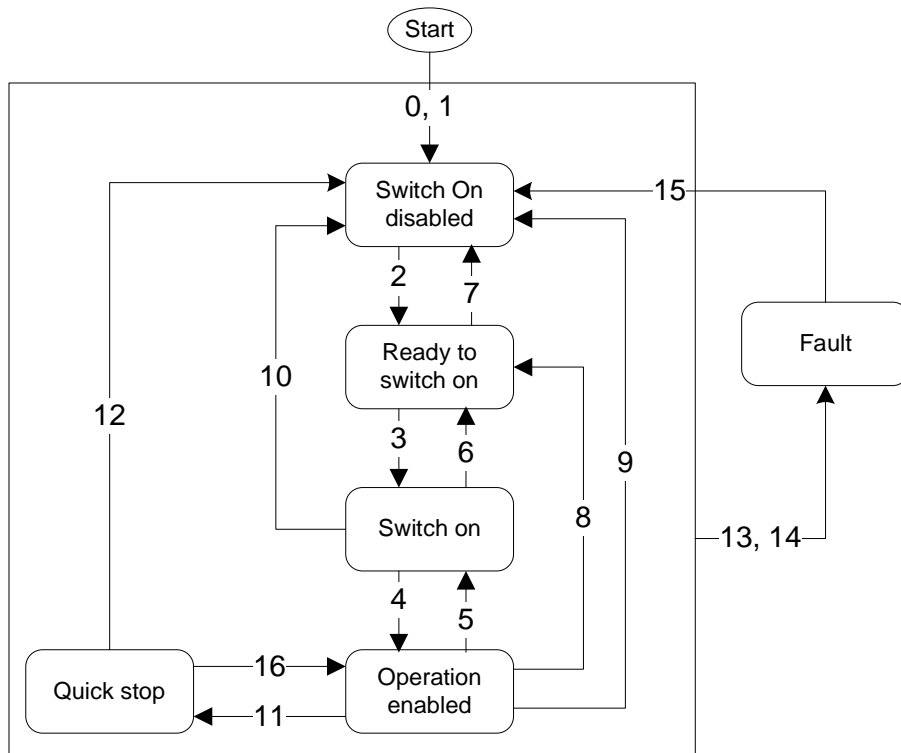

| Bit            | Function                       | Description   |
|----------------|--------------------------------|---|
| Bit 4 - Bit 6  | Defined in each operation mode | These bits are individually defined according to the operation mode, as shown in the following table. |
| Bit 7          | Fault reset                    | -   |
| Bit 8          | Halt                           | -   |
| Bit 9 - Bit 15 | Reserved                       | -   |

Bits 4 - 6 are individually defined according to the operation mode, as shown in the following table:

| Bit   | Definition in each operation mode                            |                                |  |
|-------|--|--------------------------------|--|
|       | Profile Position mode  | Homing mode                    | Profile Velocity mode<br>Profile Torque mode<br>Cyclic Synchronous Position mode<br>Cyclic Synchronous Velocity mode<br>Cyclic Synchronous Torque mode |
| Bit 4 | Command triggering (rising-edge triggered)                   | Homing (rising-edge triggered) | -  |
| Bit 5 | Function for the command to take immediate effect            | -                              | -  |
| Bit 6 | 0: absolute position command<br>1: relative position command | -                              | -  |

Note: - indicates the bit is invalid.

Finite state machine (as shown in the following diagram) defines the behavior of a servo drive system. Each state represents an internal or external behavior. For example, the servo drive can execute point-to-point motion only in the Operation enabled state.

## 12

The state transition is defined as follows:

| Transition | Event  | Action   |
|------------|--|--|
| 0, 1       | Automatic transition after power-on  | Device boot and initialization   |
| 2          | Shutdown command   | N/A  |
| 3          | Switch on command  | Servo is ready for Servo On  |
| 4          | Enable operation command   | Servo switches to Servo On and enters the mode in which the controller is allowed to issue a motion command  |
| 5          | Disable operation command  | Servo switches to Servo Off  |
| 6          | Shutdown command   | N/A  |
| 7          | Disable voltage or quick stop command  | N/A  |
| 8          | Shutdown command   | Servo switches to Servo Off  |
| 9          | Disable voltage command  | Servo switches to Servo Off  |
| 10         | Disable voltage or quick stop command  | N/A  |
| 11         | Quick stop command<br>The following two errors belong to this quick stop type:<br>1. Positive / negative limit switch triggered<br>2. Quick stop triggered by the Controlword (OD 6040h [Bit 2] = 0) | Quick stop function is enabled.<br>The time setting for deceleration to a stop is different for the two errors.<br>1. OD 2503h (P5.003)<br>2. OD 6085h |
| 12         | Disable voltage command<br>(OD 6040h = 0000 0110 or OD 6040h [Bit 1] = 0)  | Servo switches to Servo Off  |
| 13, 14     | Alarm occurs   | Servo switches to Servo Off  |
| 15         | Fault reset  | N/A  |
| 16         | Enable operation command; no alarm   | Motion operation restart.<br>The restart action is mode-dependent.   |

State transition can be achieved by issuing commands with the Controlword (OD 6040h).

The settings of OD 6040h for different commands are as follows:

| OD 6040h  |       |       |       |       | Command                         | Transition   |
|---|-------|-------|-------|-------|---------------------------------|--------------|
| Bit 7   | Bit 3 | Bit 2 | Bit 1 | Bit 0 |                                 |              |
| 0   | X     | 1     | 1     | 0     | Shutdown                        | 2, 6, 8      |
| 0   | 0     | 1     | 1     | 1     | Switch on                       | 3            |
| 0   | 1     | 1     | 1     | 1     | Switch on +<br>Enable operation | 3 + 4        |
| 0   | X     | X     | 0     | X     | Disable voltage                 | 7, 9, 10, 12 |
| 0   | X     | 0     | 1     | X     | Quick stop                      | 7, 10, 11    |
| 0   | 0     | 1     | 1     | 1     | Disable operation               | 5            |
| 0   | 1     | 1     | 1     | 1     | Enable operation                | 4, 16        |
|  | X     | X     | X     | X     | Fault reset                     | 15           |

Object 6041h: Statusword

|               |            |
|---------------|------------|
| Index         | 6041h      |
| Name          | Statusword |
| Object code   | VAR        |
| Data type     | UNSIGNED16 |
| Access        | RO         |
| PDO mapping   | Yes        |
| Setting range | UNSIGNED16 |
| Default       | 0          |

Object function:

The Statusword contains many statuses, such as Servo On, command statuses, fault signal, and quick stop. The state machine architecture is as follows:

|     |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| Bit             | Status             |                       | Description   |
|-----------------|--------------------|-----------------------|---|
| Bit 0           | Ready to switch on | Ready to be activated | Current status of the servo drive (see the following table for details).                              |
| Bit 1           | Switched on        | Servo ready           |   |
| Bit 2           | Operation enabled  | Servo On              |   |
| Bit 3           | Fault              | Fault signal          |   |
| Bit 4           | Voltage enabled    | Servo is powered on   |   |
| Bit 5           | Quick stop         | Quick stop            |   |
| Bit 6           | Switch on disabled | Servo disabled        |   |
| Bit 7           | Warning            | Warning signal        | When outputting the warning signal, the servo keeps outputting the Servo On signal.                   |
| Bit 8           | Reserved           | -                     | -   |
| Bit 9           | Remote             | Remote control        | -   |
| Bit 10          | Target reached     | Target reached        | -   |
| Bit 11          | Reserved           | -                     | -   |
| Bit 12 - Bit 13 | -                  | -                     | These bits are individually defined according to the operation mode, as shown in the following table. |
| Bit 14          | Positive limit     | Positive limit        | -   |
| Bit 15          | Negative limit     | Negative limit        | -   |

Bit 0 - Bit 6: current status of the servo drive.

| Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Description                                |
|-------|-------|-------|-------|-------|-------|-------|--|
| 0     | -     | -     | 0     | 0     | 0     | 0     | Not ready to switch on.                    |
| 1     | -     | -     | 0     | 0     | 0     | 0     | Switch on disabled.                        |
| 0     | 1     | -     | 0     | 0     | 0     | 1     | Ready to switch on.                        |
| 0     | 1     | -     | 0     | 0     | 1     | 1     | Switched on.                               |
| 0     | 1     | -     | 0     | 1     | 1     | 1     | Operation enabled (Servo On).              |
| 0     | 0     | -     | 0     | 1     | 1     | 1     | Quick stop active.                         |
| 0     | -     | -     | 1     | 1     | 1     | 1     | Fault reaction active.                     |
| 0     | -     | -     | 1     | 0     | 0     | 0     | Servo fault (servo switches to Servo Off). |

Note: 0 indicates the bit is off, 1 indicates the bit is on, and - indicates the bit is invalid.

## 12

Bit 12 - Bit 13: current status of the servo drive.

| Bit    | Definition in each operation mode                         |            |    |                    |                   |                   |                   |
|--------|---|------------|----|--------------------|-------------------|-------------------|-------------------|
|        | PP  | PV         | PT | Homing             | CSP               | CSV               | CST               |
| Bit 12 | Set-point acknowledge (servo received the command signal) | Zero speed | -  | Homing is complete | Mode is in effect | Mode is in effect | Mode is in effect |
| Bit 13 | Following error   | -          | -  | Homing error       | Following error   | -                 | -                 |

Note: - indicates the bit is invalid.

Object 605Bh: Shutdown option code

|               |                      |
|---------------|----------------------|
| Index         | 605Bh                |
| Name          | Shutdown option code |
| Object code   | VAR                  |
| Data type     | INTEGER16            |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | INTEGER16            |
| Default       | 0                    |

Object function:

OD 605Bh = 0: when Servo Off, the dynamic brake has no effect, so the motor runs freely and the machine stops only by friction.

OD 605Bh = -1: when Servo Off, the servo stops with the operation of the dynamic brake.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

Object 6060h: Modes of operation

|               |                    |
|---------------|--------------------|
| Index         | 6060h              |
| Name          | Modes of operation |
| Object code   | VAR                |
| Data type     | INTEGER8           |
| Access        | RW                 |

| 2             | Reserved                         |
| 3             | Profile Velocity mode            |
| 4             | Profile Torque mode              |
| 5             | Reserved                         |
| 6             | Homing mode                      |
| 7             | Reserved                         |
| 8             | Cyclic Synchronous Position mode |
| 9             | Cyclic Synchronous Velocity mode |
| 10            | Cyclic Synchronous Torque mode   |

Object 6061h: Modes of operation display

|               |                            |
|---------------|----------------------------|
| Index         | 6061h                      |
| Name          | Modes of operation display |
| Object code   | VAR                        |
| Data type     | INTEGER8                   |
| Access        | RO                         |
| PDO mapping   | Yes                        |
| Setting range | INTEGER8                   |
| Default       | 0                          |

Object function:

This object displays the current operation mode. Refer to the table in OD 6060h.

Object 6062h: Position demand value (PUU)

|               |                       |
|---------------|-----------------------|
| Index         | 6062h                 |
| Name          | Position demand value |
| Object code   | VAR                   |
| Data type     | INTEGER32             |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER32             |
| Default       | 0                     |
| Unit          | PUU                   |

Object function:

This position demand value is the interpolation command calculated by the servo internal interpolator. This command passes through the servo internal filter. For its detailed location, refer to the servo architecture diagram of each mode.

Object 6063h: Position actual internal value (Pulse)

|               |  |
|---------------|--|
| Index         | 6063h  |
| Name          | Position actual internal value   |
| Object code   | VAR  |
| Data type     | INTEGER32  |
| Access        | RO   |
| PDO mapping   | Yes  |
| Setting range | INTEGER32  |
| Default       | 0  |
| Unit          | Pulse (unit for encoder pulse resolution)<br>The ASDA-A2 servo drive generates 1,280,000 pulses per motor revolution.<br>The ASDA-A3 / ASDA-B3 servo drive generates 16,777,216 pulses per motor revolution. |

Object 6064h: Position actual value (PUU)

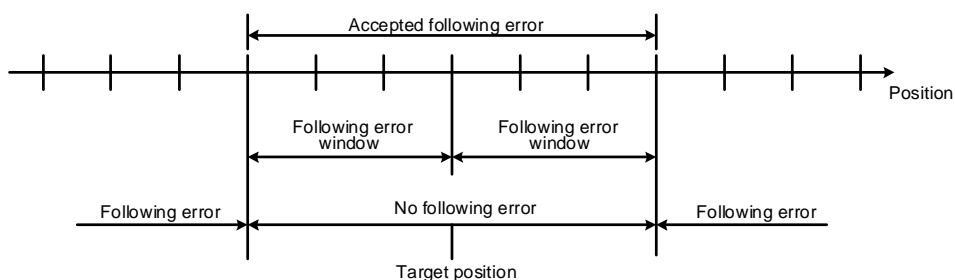

|               |                       |
|---------------|-----------------------|
| Index         | 6064h                 |
| Name          | Position actual value |
| Object code   | VAR                   |
| Data type     | INTEGER32             |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER32             |
| Default       | 0                     |
| Unit          | PUU                   |

Object 6065h: Following error window

|               |                        |
|---------------|------------------------|
| Index         | 6065h                  |
| Name          | Following error window |
| Object code   | VAR                    |
| Data type     | UNSIGNED32             |
| Access        | RW                     |
| PDO mapping   | Yes                    |
| Setting range | UNSIGNED32             |
| Default       | 50331648               |
| Unit          | PUU                    |

Object function:

When the following error actual value (OD 60F4h) exceeds this setting range, AL009 (Excessive deviation of Position command) is triggered.

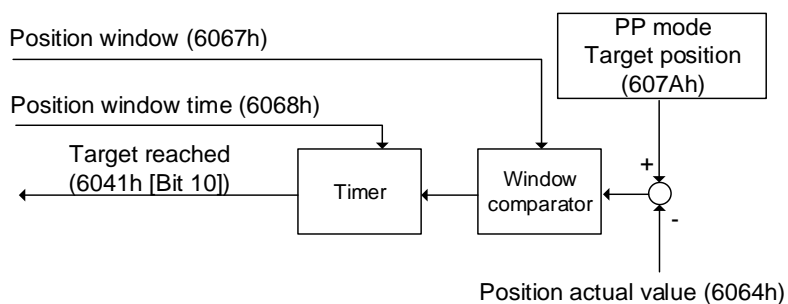

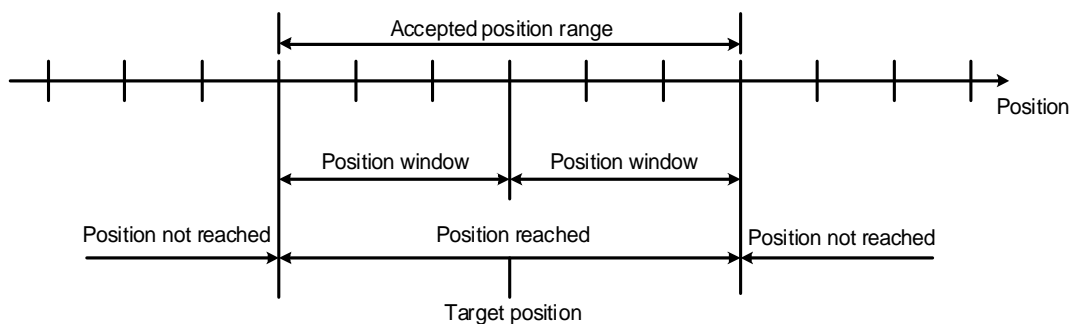

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

Object 6067h: Position window

|               |                 |
|---------------|-----------------|
| Index         | 6067h           |
| Name          | Position window |
| Object code   | VAR             |
| Data type     | UNSIGNED32      |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | UNSIGNED32      |
| Default       | 100             |
| Unit          | PUU             |

Object function:

When the difference (absolute value) between the target position (PP mode: OD 607Ah) and the position actual value (OD 6064h) is within the range set in OD 6067h (Position window), and the duration of this condition is longer than the time set in OD 6068h (Position window time), OD 6041h [Bit 10] (Target reached) is output.

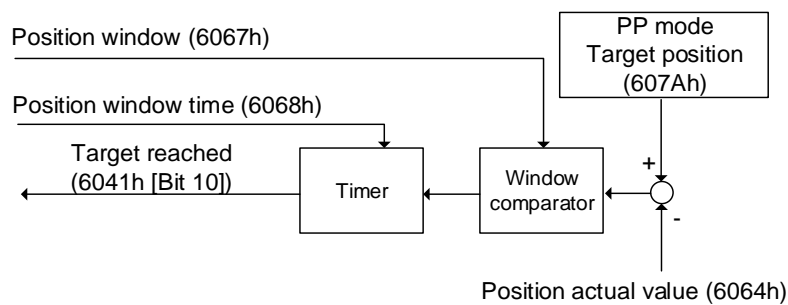

Object 6068h: Position window time

|               |                      |
|---------------|----------------------|
| Index         | 6068h                |
| Name          | Position window time |
| Object code   | VAR                  |
| Data type     | UNSIGNED16           |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | UNSIGNED16           |
| Default       | 0                    |
| Unit          | ms                   |

Object function:

When the difference (absolute value) between the target position (PP mode: OD 607Ah) and the position actual value (OD 6064h) is within the range set in OD 6067h (Position window), and the duration of this condition is longer than the time set in OD 6068h (Position window time), OD 6041h [Bit 10] (Target reached) is output.

Object 606Bh: Velocity demand value

|               |                       |
|---------------|-----------------------|
| Index         | 606Bh                 |
| Name          | Velocity demand value |
| Object code   | VAR                   |
| Data type     | INTEGER32             |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER32             |
| Unit          | 0.1 rpm               |

Object function:

The velocity demand value is a command generated by the speed trajectory generator and filtered by the command filter of the drive. This object only works in Profile Velocity mode and Cyclic Synchronous Velocity mode.

Object 606Ch: Velocity actual value

|               |                       |
|---------------|-----------------------|
| Index         | 606Ch                 |
| Name          | Velocity actual value |
| Object code   | VAR                   |
| Data type     | INTEGER32             |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER32             |
| Unit          | 0.1 rpm               |

Object function:

Returns the motor speed at present for monitoring.

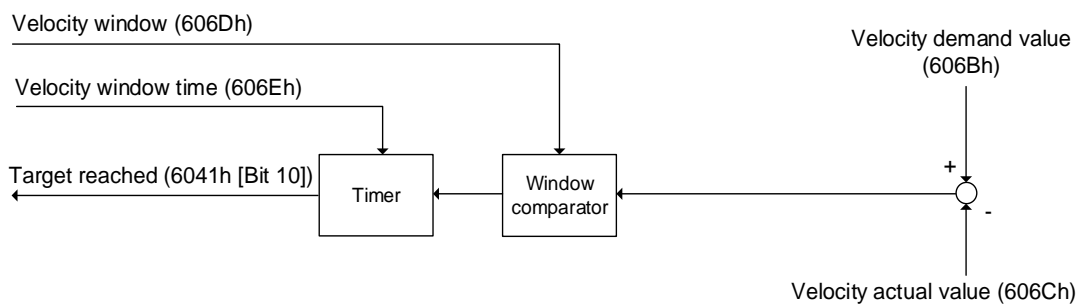

Object 606Dh: Velocity window

|               |                 |
|---------------|-----------------|
| Index         | 606Dh           |
| Name          | Velocity window |
| Object code   | VAR             |
| Data type     | UNSIGNED16      |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | 0 - 3000        |
| Default       | 100             |
| Unit          | 0.1 rpm         |

Object function:

The window comparator compares the speed difference with the velocity window (OD 606Dh). When the difference (absolute value) is within the range set in the velocity window and the duration of this condition is longer than the time set in the velocity window time (OD 606Eh), OD 6041h [Bit 10] (Target reached) is output. This object only works in Profile Velocity mode.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 606Eh: Velocity window time

|               |                      |
|---------------|----------------------|
| Index         | 606Eh                |
| Name          | Velocity window time |
| Object code   | VAR                  |
| Data type     | UNSIGNED16           |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | UNSIGNED16           |
| Default       | 0                    |
| Unit          | ms                   |

Object function:

Refer to OD 606Dh for the description of the object.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 606Fh: Velocity threshold

|               |                    |
|---------------|--------------------|
| Index         | 606Fh              |
| Name          | Velocity threshold |
| Object code   | VAR                |
| Data type     | UNSIGNED16         |
| Access        | RW                 |
| PDO mapping   | Yes                |
| Setting range | 0 - 2000           |
| Default       | 100                |
| Unit          | 0.1 rpm            |

Object function:

This object sets the range for the zero-speed signal output. When the forward or reverse speed (absolute value) of the motor is lower than the setting value of OD 606Fh, OD 6041h [Bit 12] (zero-speed signal) outputs 1.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 6071h: Target torque

|               |                |
|---------------|----------------|
| Index         | 6071h          |
| Name          | Target torque  |
| Object code   | VAR            |
| Data type     | INTEGER16      |
| Access        | RW             |
| PDO mapping   | Yes            |
| Setting range | -3500 to +3500 |
| Default       | 0              |
| Unit          | 0.1%           |

Object function:

This object sets the target torque in Profile Torque mode and Cyclic Synchronous Torque mode. If OD 6071h = 1000 (100.0%), it corresponds to the motor rated torque.

## Object 6072h: Max torque

|               |            |
|---------------|------------|
| Index         | 6072h      |
| Name          | Max torque |
| Object code   | VAR        |
| Data type     | UNSIGNED16 |
| Access        | RW         |
| PDO mapping   | Yes        |
| Setting range | 0 - 3500   |
| Default       | 3500       |
| Unit          | 0.1%       |

## Object function:

This object sets the maximum torque in Profile Torque mode and Cyclic Synchronous Torque mode.

## Object 6074h: Torque demand value

|               |                     |
|---------------|---------------------|
| Index         | 6074h               |
| Name          | Torque demand value |
| Object code   | VAR                 |
| Data type     | INTEGER16           |
| Access        | RO                  |
| PDO mapping   | Yes                 |
| Setting range | INTEGER16           |
| Default       | 0                   |
| Unit          | 0.1%                |

## Object function:

The torque demand value is the command generated by the speed trajectory generator and filtered by the command filter of the drive. This object only works in Profile Torque mode and Cyclic Synchronous Torque mode.

## Object 6075h: Motor rated current

|               |                     |
|---------------|---------------------|
| Index         | 6075h               |
| Name          | Motor rated current |
| Object code   | VAR                 |
| Data type     | UNSIGNED32          |
| Access        | RO                  |
| PDO mapping   | Yes                 |
| Setting range | UNSIGNED32          |
| Default       | 0                   |
| Unit          | mA                  |

## Object function:

This object displays the rated current specified on the motor nameplate.

## 12

## Object 6076h: Motor rated torque

|               |                    |
|---------------|--------------------|
| Index         | 6076h              |
| Name          | Motor rated torque |
| Object code   | VAR                |
| Data type     | UNSIGNED32         |
| Access        | RO                 |
| PDO mapping   | Yes                |
| Setting range | UNSIGNED32         |
| Default       | 0                  |
| Unit          | 0.001 N-m          |

## Object function:

This object displays the rated torque specified on the motor nameplate.

## Object 6077h: Torque actual value

|               |                     |
|---------------|---------------------|
| Index         | 6077h               |
| Name          | Torque actual value |
| Object code   | VAR                 |
| Data type     | INTEGER16           |
| Access        | RO                  |
| PDO mapping   | Yes                 |
| Setting range | INTEGER16           |
| Default       | 0                   |
| Unit          | 0.1%                |

## Object function:

This object is the motor torque feedback in percentage at present.

## Object 6078h: Current actual value

|               |                      |
|---------------|----------------------|
| Index         | 6078h                |
| Name          | Current actual value |
| Object code   | VAR                  |
| Data type     | INTEGER16            |
| Access        | RO                   |
| PDO mapping   | Yes                  |
| Setting range | INTEGER16            |
| Default       | 0                    |
| Unit          | 0.1%                 |

## Object function:

This object is the motor current feedback in percentage at present.

Object 607Ah: Target position

|               |                 |
|---------------|-----------------|
| Index         | 607Ah           |
| Name          | Target position |
| Object code   | VAR             |
| Data type     | INTEGER32       |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | INTEGER32       |
| Default       | 0               |
| Unit          | PUU             |

Object function:

This object only works in Profile Position mode and Cyclic Synchronous Position mode. For more details, refer to Sections 12.3.1 and 12.3.5.

Object 607Ch: Home offset

|               |             |
|---------------|-------------|
| Index         | 607Ch       |
| Name          | Home offset |
| Object code   | VAR         |
| Data type     | INTEGER32   |
| Access        | RW          |
| PDO mapping   | Yes         |
| Setting range | INTEGER32   |
| Default       | 0           |
| Unit          | PUU         |

Object function:

The origin reference point which the system looks for during the homing procedure is Home position, such as the origin sensor and Z pulse. When the origin reference point is found, the position offset from this point is the user-defined origin (Zero position), and the offset value is Home offset.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

Object 607Dh: Software position limit

|             |                         |
|-------------|-------------------------|
| Index       | 607Dh                   |
| Name        | Software position limit |
| Object code | ARRAY                   |
| Data type   | INTEGER32               |
| Access      | RW                      |

## 12

|               |                   |
|---------------|-------------------|
| Sub-index     | 0                 |

| Unit          | PUU                        |

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 607Fh: Max profile velocity

|                               |                                     |
|-------------------------------|-------------------------------------|
| Index                         | 607Fh                               |
| Name                          | Max profile velocity                |
| Object code                   | VAR                                 |
| Data type                     | UNSIGNED32                          |
| Access                        | RW                                  |
| PDO mapping                   | Yes                                 |
| Setting range                 | UNSIGNED32                          |
| Default                       | Varies depending on the motor model |
| Corresponding servo parameter | P1.055 (rpm) / 10                   |
| Unit                          | 0.1 rpm                             |

Object function:

The setting value of OD 607Fh (unit: 0.1 rpm) multiplied by 10 is equivalent to the setting value of P1.055 (Maximum speed limit; unit: 1 rpm).

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 6080h: Max motor speed

|                               |                                     |
|-------------------------------|-------------------------------------|
| Index                         | 6080h                               |
| Name                          | Max motor speed                     |
| Object code                   | VAR                                 |
| Data type                     | UNSIGNED32                          |
| Access                        | RW                                  |
| PDO mapping                   | Yes                                 |
| Setting range                 | UNSIGNED32                          |
| Default                       | Varies depending on the motor model |
| Corresponding servo parameter | P1.055                              |
| Unit                          | rpm                                 |

## Object function:

OD 6080h is equivalent to P1.055 (Maximum speed limit).

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 6081h: Profile velocity

|               |                  |
|---------------|------------------|
| Index         | 6081h            |
| Name          | Profile velocity |
| Object code   | VAR              |
| Data type     | UNSIGNED32       |
| Access        | RW               |
| PDO mapping   | Yes              |
| Setting range | UNSIGNED32       |
| Default       | 10000            |
| Unit          | PUU/s            |

## Object function:

This object only works in Profile Position mode. For more details, refer to Section 12.3.1.

## Object 6083h: Profile acceleration

|               |                      |
|---------------|----------------------|
| Index         | 6083h                |
| Name          | Profile acceleration |
| Object code   | VAR                  |
| Data type     | UNSIGNED32           |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | 1 - 65500            |
| Default       | 200                  |
| Unit          | ms                   |

## Object function:

The time slope set by this object is the time required for the motor to accelerate from 0 rpm to 3,000 rpm. This object only works in Profile Position mode and Profile Velocity mode.

# 12

Object 6084h: Profile deceleration

|               |                      |
|---------------|----------------------|
| Index         | 6084h                |
| Name          | Profile deceleration |
| Object code   | VAR                  |
| Data type     | UNSIGNED32           |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | 1 - 65500            |
| Default       | 200                  |
| Unit          | ms                   |

Object function:

The time slope set by this object is the time required for the motor to decelerate from 3,000 rpm to 0 rpm. This object only works in Profile Position mode and Profile Velocity mode.

Object 6085h: Quick stop deceleration

|               |                         |
|---------------|-------------------------|
| Index         | 6085h                   |
| Name          | Quick stop deceleration |
| Object code   | VAR                     |
| Data type     | UNSIGNED32              |
| Access        | RW                      |
| PDO mapping   | Yes                     |
| Setting range | 1 - 65500               |
| Default       | 200                     |
| Unit          | ms                      |

Object function:

The time slope set by this object is the time required for the motor to decelerate from 3,000 rpm to 0 rpm using the quick stop function.

Object 6086h: Motion profile type

|               |                     |
|---------------|---------------------|
| Index         | 6086h               |
| Name          | Motion profile type |
| Object code   | VAR                 |
| Data type     | INTEGER16           |
| Access        | RO                  |
| PDO mapping   | Yes                 |
| Setting range | 0                   |
| Default       | 0                   |

Object function:

This object sets the type of motion profile for operation. Currently, only linear ramp (trapezoidal profile) is available.

| Setting value | Mode                              |
|---------------|-----------------------------------|
| 0             | Linear ramp (trapezoidal profile) |

## Object 6087h: Torque slope

|               |              |
|---------------|--------------|
| Index         | 6087h        |
| Name          | Torque slope |
| Object code   | VAR          |
| Data type     | UNSIGNED32   |
| Access        | RW           |
| PDO mapping   | Yes          |
| Setting range | 0 - 65500    |
| Default       | 200          |
| Unit          | ms           |

## Object function:

The time slope set by this object is the time required for the motor to change from 0% to 100% of the rated torque.

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 6093h: Position factor

|                               |   |
|-------------------------------|---|
| Index                         | 6093h                                       |
| Name                          | Position factor                             |
| Object code                   | ARRAY                                       |
| Data type                     | UNSIGNED32                                  |
| Access                        | RW  |
| PDO mapping                   | Yes   |
| Corresponding servo parameter | P1.044 and P1.045                           |
| Note                          | Position factor = Numerator / Feed_constant |

|               |                     |
|---------------|---------------------|
| Sub-index     | 0                   |
| Description   | Number of sub-index |
| Data type     | UNSIGNED8           |
| Access        | RO                  |
| PDO mapping   | No                  |
| Setting range | 2                   |
| Default       | 2                   |

|                               |   |
|-------------------------------|---|
| Sub-index                     | 1   |
| Description                   | E-Gear ratio numerator                                |
| Data type                     | UNSIGNED32  |
| Access                        | RW  |
| PDO mapping                   | Yes   |
| Default                       | 1   |
| Corresponding servo parameter | P1.044  |
| Note                          | For the E-Gear ratio setting, refer to Section 6.2.5. |

# 12

|                               |   |
|-------------------------------|---|
| Sub-index                     | 2   |
| Description                   | E-Gear ratio denominator                              |
| Data type                     | UNSIGNED32  |
| Access                        | RW  |
| PDO mapping                   | Yes   |
| Default                       | 1   |
| Corresponding servo parameter | P1.045  |
| Note                          | For the E-Gear ratio setting, refer to Section 6.2.5. |

Note: when P3.012.Z is set to 1, the non-volatile setting for this object is enabled.

## Object 6098h: Homing method

|               |               |
|---------------|---------------|
| Index         | 6098h         |
| Name          | Homing method |
| Object code   | VAR           |
| Data type     | INTEGER8      |
| Access        | RW            |
| PDO mapping   | Yes           |
| Setting range | -4 to 35      |
| Default       | 0             |

### Object function:

The homing methods include looking for the Z pulse (Methods 1 - 14, 33, 34, 36, 37), not looking for the Z pulse (Methods 17 - 30), defining the current position as the origin (Method 35), and looking for the hard stop (Methods 36 - 39). Methods 15, 16, 31, and 32 are reserved. To use Methods 1 to 35, set OD 6098h to 1 to 35. To use Methods 36 to 39, set OD 6098h to -1 to -4.

### Method 1: homing on the negative limit switch and Z pulse

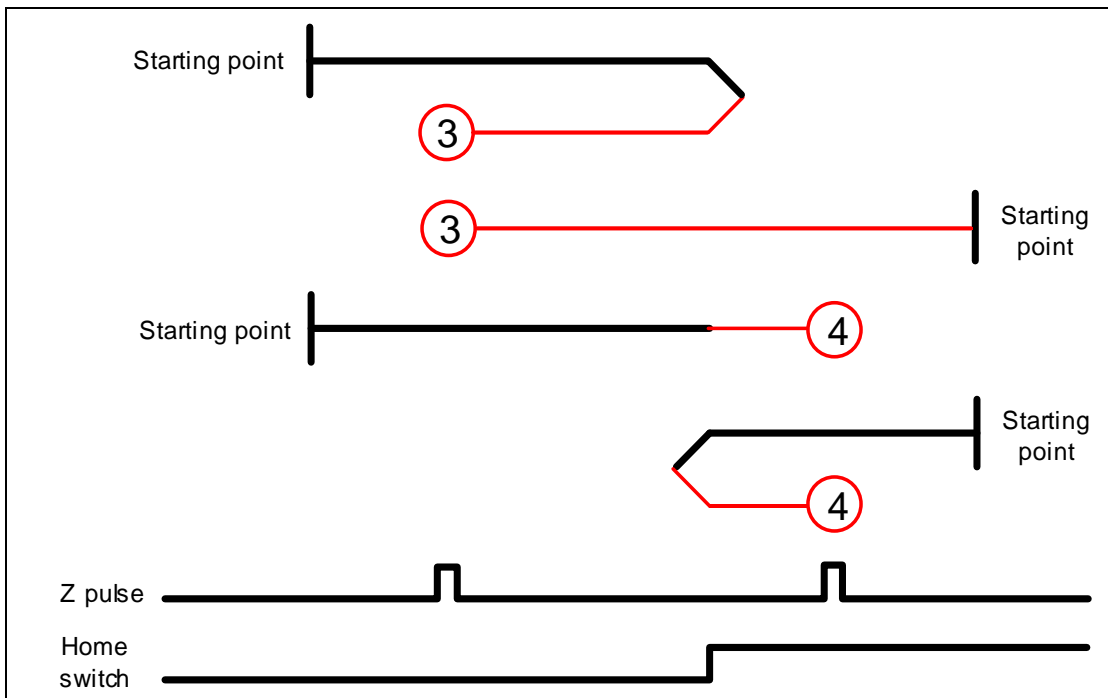

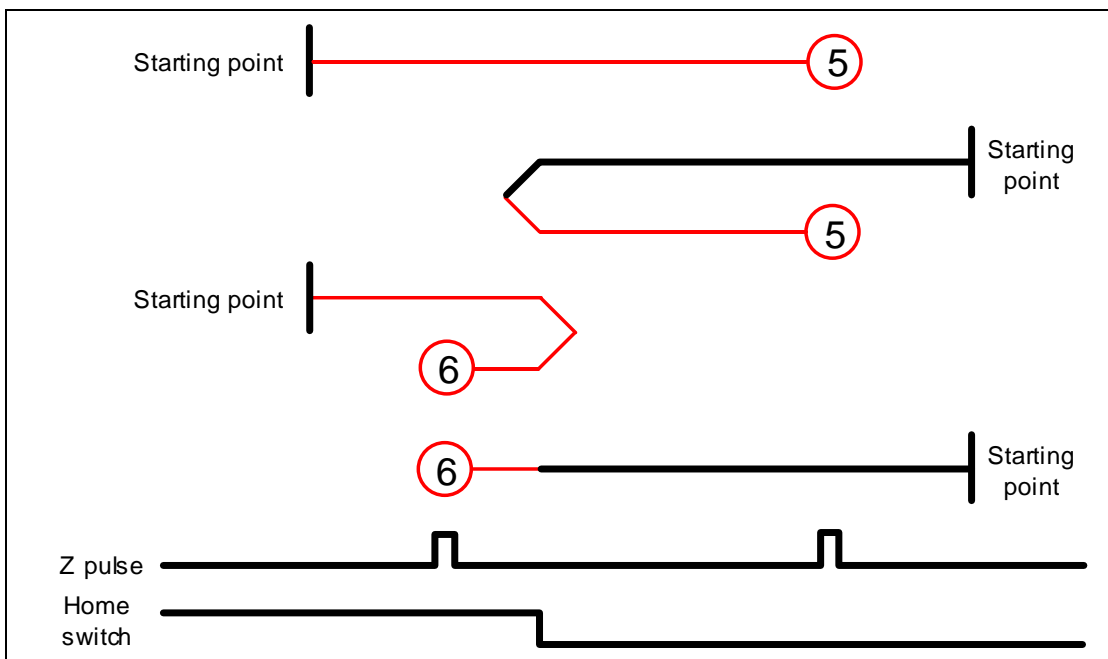

Method 2: homing on the positive limit switch and Z pulse

Methods 3 and 4: homing on the home switch and Z pulse

Methods 5 and 6: homing on the home switch and Z pulse

# 12

Method 7: homing on the positive limit switch, home switch, and Z pulse

Method 8: homing on the positive limit switch, home switch, and Z pulse

Method 9: homing on the positive limit switch, home switch, and Z pulse

12

Method 10: homing on the positive limit switch, home switch, and Z pulse

# 12

Method 11: homing on the negative limit switch, home switch, and Z pulse

Method 12: homing on the negative limit switch, home switch, and Z pulse

Method 13: homing on the negative limit switch, home switch, and Z pulse

Method 14: homing on the negative limit switch, home switch, and Z pulse

Methods 15 and 16: reserved

Method 17: homing on the negative limit switch

# 12

Method 18: homing on the positive limit switch

Methods 19 and 20: homing on the home switch

Methods 21 and 22: homing on the home switch

Methods 23 and 24: homing on the positive limit switch and home switch

12

Methods 25 and 26: homing on the positive limit switch and home switch

# 12

Methods 27 and 28: homing on the negative limit switch and home switch

Methods 29 and 30: homing on the negative limit switch and home switch

Methods 31 and 32: reserved

Methods 33 and 34: homing on the Z pulse

Method 35: defines the current feedback position as the origin

Methods 36 and 37:

When OD 6098h is set to -1 or -2: homing on the hard stop and Z pulse. Set the servo parameters P1.087 (torque level detection) and P1.088 (level reached timer) when using these homing methods.

Methods 38 and 39:

When OD 6098h is set to -3 or -4: homing on the hard stop. Set the servo parameters P1.087 (torque level detection) and P1.088 (level reached timer) when using these homing methods.

## 12

## Object 6099h: Homing speeds

|             |               |
|-------------|---------------|
| Index       | 6099h         |

| Description   | Speed during search for switch |
| Data type     | UNSIGNED32                     |
| Access        | RW                             |
| PDO mapping   | Yes                            |
| Setting range | 1 - 20000                      |
| Default       | 100                            |
| Unit          | 0.1 rpm                        |

|               |                              |
|---------------|------------------------------|
| Sub-index     | 2                            |
| Description   | Speed during search for zero |
| Data type     | UNSIGNED32                   |
| Access        | RW                           |
| PDO mapping   | Yes                          |
| Setting range | 1 - 5000                     |
| Default       | 20                           |
| Unit          | 0.1 rpm                      |

## Object 609Ah: Homing acceleration

|               |                     |
|---------------|---------------------|
| Index         | 609Ah               |
| Name          | Homing acceleration |
| Object code   | VAR                 |
| Data type     | UNSIGNED32          |
| Access        | RW                  |
| PDO mapping   | Yes                 |
| Setting range | UNSIGNED32          |
| Default       | 100                 |
| Unit          | ms                  |

## Object function:

The time slope set by this object is the time required for the motor to accelerate from 0 rpm to 3,000 rpm and decelerate from 3,000 rpm to 0 rpm. This object only works in Homing mode.

## Object 60B0h: Position offset

|               |                 |
|---------------|-----------------|
| Index         | 60B0h           |
| Name          | Position offset |
| Object code   | VAR             |
| Data type     | INTEGER32       |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | INTEGER32       |
| Default       | 0               |
| Unit          | PUU             |

## Object function:

This object sets the position offset. For more details, refer to Section 12.3.5 Cyclic Synchronous Position mode.

## Object 60B1h: Velocity offset

|               |                 |
|---------------|-----------------|
| Index         | 60B1h           |
| Name          | Velocity offset |
| Object code   | VAR             |
| Data type     | INTEGER32       |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | INTEGER32       |
| Default       | 0               |
| Unit          | 0.1 rpm         |

## Object function:

This object sets the velocity offset. For more details, refer to Section 12.3.6 Cyclic Synchronous Velocity mode.

# 12

## Object 60B2h: Torque offset

|               |                |
|---------------|----------------|
| Index         | 60B2h          |
| Name          | Torque offset  |
| Object code   | VAR            |
| Data type     | INTEGER16      |
| Access        | RW             |
| PDO mapping   | Yes            |
| Setting range | -3500 to +3500 |
| Default       | 0              |
| Unit          | 0.1%           |

Object function:

This object sets the torque offset. For more details, refer to Section 12.3.7 Cyclic Synchronous Torque mode.

## Object 60B8h: Touch probe function

|               |                      |
|---------------|----------------------|
| Index         | 60B8h                |
| Name          | Touch probe function |
| Object code   | VAR                  |
| Data type     | UNSIGNED16           |
| Access        | RW                   |
| PDO mapping   | Yes                  |
| Setting range | UNSIGNED16           |
| Default       | 0                    |

Object function:

This object sets the Touch Probe related function settings. For the operation details, refer to Section 12.3.8 for the description of Touch Probe.

|     |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| Access        | RO                         |
| PDO mapping   | Yes                        |
| Setting range | INTEGER32                  |
| Default       | 0                          |

Object function:

For the function of this object, refer to Section 12.3.8 for the description of Touch Probe.

## Object 60BCh: Touch probe pos2 pos value

|               |                            |
|---------------|----------------------------|
| Index         | 60BCh                      |
| Name          | Touch probe pos2 pos value |
| Object code   | VAR                        |
| Data type     | INTEGER32                  |
| Access        | RO                         |
| PDO mapping   | Yes                        |
| Setting range | INTEGER32                  |
| Default       | 0                          |

Object function:

For the function of this object, refer to Section 12.3.8 for the description of Touch Probe.

## Object 60BDh: Touch probe pos2 neg value

|               |                            |
|---------------|----------------------------|
| Index         | 60BDh                      |
| Name          | Touch probe pos2 neg value |
| Object code   | VAR                        |
| Data type     | INTEGER32                  |
| Access        | RO                         |
| PDO mapping   | Yes                        |
| Setting range | INTEGER32                  |
| Default       | 0                          |

Object function:

For the function of this object, refer to Section 12.3.8 for the description of Touch Probe.

## Object 60C5h: Max acceleration

|               |                  |
|---------------|------------------|
| Index         | 60C5h            |
| Name          | Max acceleration |
| Object code   | VAR              |
| Data type     | UNSIGNED32       |
| Access        | RW               |
| PDO mapping   | Yes              |
| Setting range | 1 - 65500        |
| Default       | 1                |
| Unit          | ms               |

Object function:

The time slope set by this object is the time required for the motor to accelerate from 0 rpm to 3,000 rpm.

## 12

## Object 60C6h: Max deceleration

|               |                  |
|---------------|------------------|
| Index         | 60C6h            |
| Name          | Max deceleration |
| Object code   | VAR              |
| Data type     | UNSIGNED32       |
| Access        | RW               |
| PDO mapping   | Yes              |
| Setting range | 1 - 65500        |
| Default       | 1                |
| Unit          | ms               |

## Object function:

The time slope set by this object is the time required for the motor to decelerate from 3,000 rpm to 0 rpm.

## Object 60E0h: Positive torque limit

|               |                       |
|---------------|-----------------------|
| Index         | 60E0h                 |
| Name          | Positive torque limit |
| Object code   | VAR                   |
| Data type     | UNSIGNED16            |
| Access        | RW                    |
| PDO mapping   | Yes                   |
| Setting range | 0 - 3000              |
| Default       | 3000                  |
| Unit          | 0.1%                  |

## Object function:

This object sets the positive torque limit.

## Object 60E1h: Negative torque limit

|               |                       |
|---------------|-----------------------|
| Index         | 60E1h                 |
| Name          | Negative torque limit |
| Object code   | VAR                   |
| Data type     | UNSIGNED16            |
| Access        | RW                    |
| PDO mapping   | Yes                   |
| Setting range | 0 - 3000              |
| Default       | 3000                  |
| Unit          | 0.1%                  |

## Object function:

This object sets the negative torque limit.

Object 60F4h: Following error actual value

|               |                              |
|---------------|------------------------------|
| Index         | 60F4h                        |
| Name          | Following error actual value |
| Object code   | VAR                          |
| Data type     | INTEGER32                    |
| Access        | RO                           |
| PDO mapping   | Yes                          |
| Setting range | INTEGER32                    |
| Default       | 0                            |
| Unit          | PUU                          |

Object function:

The following error actual value is the difference between the position demand value (OD 6062h) and position actual value (OD 6064h). For more details, refer to the architecture diagrams in Section 12.3.

Object 60FCh: Position demand value

|               |                       |
|---------------|-----------------------|
| Index         | 60FCh                 |
| Name          | Position demand value |
| Object code   | VAR                   |
| Data type     | INTEGER32             |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | INTEGER32             |
| Default       | 0                     |
| Unit          | pulse                 |

Object function:

This command is generated after being processed by the servo drive filter. For more details, refer to the architecture diagrams in Section 12.3.

# 12

| Bit     | DO  | Description                            |
|---------|-----|--|
| 0 - 15  | -   | Reserved                               |
| 16      | DO1 | 0: disable physical outputs; 1: enable |
| 17      | DO2 | 0: disable physical outputs; 1: enable |
| 18      | DO3 | 0: disable physical outputs; 1: enable |
| 19      | DO4 | 0: disable physical outputs; 1: enable |
| 20 - 31 | -   | Reserved                               |

- To use the software to control the DO output, you must first set the corresponding DO function code.

When P2.018 = 0x0130, the output of DO1 is controlled by the software.

When P2.019 = 0x0131, the output of DO2 is controlled by the software.

When P2.020 = 0x0132, the output of DO3 is controlled by the software.

When P2.021 = 0x0133, the output of DO4 is controlled by the software.

- DO output settings

When the corresponding OD 60FEh sub2 bit of the DO is set to 1, the output status of this DO is determined by the corresponding bit of OD 60FEh sub1.

When the corresponding OD 60FEh sub2 bit of the DO is set to 0, the output status of this DO is determined by P4.006.

- Example

1. Set P2.018 to 0x0130, which means the output of DO1 is controlled by the software.
2. When OD 60FEh sub2 [Bit 16] is 1, the output of DO1 is determined by 0x60FE sub1 [Bit 16]. When OD 60FEh sub2 [Bit 16] is 0, the output of DO1 is determined by P4.006 [Bit 0].

Object 60FFh: Target velocity

|               |                 |
|---------------|-----------------|
| Index         | 60FFh           |
| Name          | Target velocity |
| Object code   | VAR             |
| Data type     | INTEGER32       |
| Access        | RW              |
| PDO mapping   | Yes             |
| Setting range | INTEGER32       |
| Default       | 0               |
| Unit          | 0.1 rpm         |

Object function:

This object sets the target velocity. This object only works in Profile Velocity mode and Cyclic Synchronous Velocity mode.

Object 6502h: Supported drive modes

|               |                       |
|---------------|-----------------------|
| Index         | 6502h                 |
| Name          | Supported drive modes |
| Object code   | VAR                   |
| Data type     | UNSIGNED32            |
| Access        | RO                    |
| PDO mapping   | Yes                   |
| Setting range | UNSIGNED32            |
| Default       | 03ADh                 |

Object function:

This object is read-only and provides the operation modes supported by Delta servo drives in EtherCAT mode.

|     |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit             | Function                         |
|-----------------|----------------------------------|
| Bit 0           | Profile Position mode            |
| Bit 1           | Reserved                         |
| Bit 2           | Profile Velocity mode            |
| Bit 3           | Profile Torque mode              |
| Bit 4           | Reserved                         |
| Bit 5           | Homing mode                      |
| Bit 6           | Reserved                         |
| Bit 7           | Cyclic Synchronous Position mode |
| Bit 8           | Cyclic Synchronous Velocity mode |
| Bit 9           | Cyclic Synchronous Torque mode   |
| Bit 10 - Bit 31 | Reserved                         |

## 12

## 12.5 Diagnostics and troubleshooting

This section provides diagnostics and troubleshooting information related to communication with the controller or interference elimination. For information about the servo drive alarms, refer to Chapter 14 Troubleshooting.

1. The SYNC communication cycle of the controller and servo drive is different

Since the jitter of each controller is different, the time the servo drive receives the SYNC differs from the SYNC communication cycle time. When this happens, adjust the value of P3.009.Z to increase the error range and let the servo drive automatically correct the internal timer so it is consistent with the communication cycle of the controller.

2. Eliminate interference

Packets are particularly sensitive to interference in high-speed network communication applications. To achieve fast and high-precision control, the selection of the wire is extremely important. Use shielded cables for the communication wiring, and make sure that the shielded connector is firmly connected to the servo drive communication port. Also, ensure the ground wire is properly connected and grounded.

### 12.5.1 EtherCAT Diagnosis

The EtherCAT automatic error diagnostic function must be used with the ASDA-Soft software of version 6.1.2.0 or above. To use this function, activate **EtherCAT Diagnosis** in ASDA-Soft and press **Diagnosis** to get the following EtherCAT connection information for error detection.

1. Check if the servo parameter P1.001.YX is set to 0C for communication mode.
2. Port hardware detection (check if Port0 or Port1 is connected).
3. Time synchronization status (Cycle time and DC time).
4. Physical address (Config ID) and logical address (P3.000) information.
5. Check the content of PDO mapping to determine if the configuration is correct.
6. SM0 - SM3: the channels used by the SDO & PDO and the channel length information.
7. FMMU0 - FMMU3 configuration information.
8. EtherCAT state machine display (Init → Pre-Op → Safe-Op → Op).
9. Status display for EtherCAT communication initialization application layer (Application Layer Error Code).
10. EtherCAT communication error rate display.
11. Controlword (OD 6040h) and Statusword (OD 6041h) display.
12. EtherCAT operation mode status display (OD 6060h, 6061h, 6071h, 6072h, 6080h, 60FFh, 60E0h, 60E1h, and 607Ah)

Note: refer to the latest version of the ASDA-Soft software for the updated functions of **EtherCAT Diagnosis**.

## 12.5.2 Alarm list

| Display | Alarm name   | 16-bit error code |
|---------|--|-------------------|
| AL001   | Overcurrent  | 2310h             |
| AL002   | Overvoltage  | 3110h             |
| AL003   | Undervoltage                                       | 3120h             |
| AL004   | Motor combination error                            | 7122h             |
| AL005   | Regeneration error                                 | 3210h             |
| AL006   | Overload   | 3230h             |
| AL007   | Excessive deviation of Speed command               | 8400h             |
| AL008   | Abnormal pulse command                             | 8600h             |
| AL009   | Excessive deviation of Position command            | 8611h             |
| AL010   | Voltage error during regeneration                  | 3210h             |
| AL011   | CN2 communication failed                           | 7305h             |
| AL013   | Emergency stop                                     | 5441h             |
| AL014   | Negative limit error                               | 5443h             |
| AL015   | Positive limit error                               | 5442h             |
| AL016   | Abnormal IGBT temperature                          | 4210h             |
| AL017   | EEPROM error                                       | 5330h             |
| AL018   | OA and OB output error                             | 7306h             |
| AL020   | Serial communication timeout                       | 7520h             |
| AL022   | RST power error                                    | 3130h             |
| AL023   | Early overload warning                             | 3231h             |
| AL024   | Encoder initial magnetic field error               | 7305h             |
| AL025   | Encoder internal error                             | 7305h             |
| AL026   | Encoder unreliable internal data                   | 7305h             |
| AL027   | Encoder internal reset error                       | 7305h             |
| AL028   | Battery voltage error or encoder internal error    | 7305h             |
| AL029   | Gray code error                                    | 7305h             |
| AL02A   | Number of revolutions of the encoder is in error   | 7305h             |
| AL02B   | Motor data error                                   | 7305h             |
| AL02C   | Servo drive overload                               | 3230h             |
| AL02F   | Blocked rotor protection                           | 0000h             |
| AL030   | Motor collision error                              | 7121h             |
| AL031   | Motor power cable wiring error                     | 3300h             |
| AL032   | Abnormal encoder vibration                         | 7305h             |
| AL033   | Motor is in error                                  | 7305h             |
| AL034   | Encoder internal communication error               | 7305h             |
| AL035   | Encoder temperature exceeds the protective range   | 7305h             |
| AL036   | Encoder alarm status error                         | 7305h             |
| AL042   | Voltage input for analog Speed command is too high | FF01h             |
| AL044   | Servo function operational warning                 | 6100h             |
| AL045   | E-Gear ratio value error                           | 6320h             |
| AL048   | OA and OB output error                             | 7036h             |
| AL053   | Motor parameter error                              | 0000h             |
| AL056   | Excessive motor speed                              | 0000h             |
| AL05C   | Motor position feedback error                      | 0000h             |
| AL060   | Absolute position is lost                          | 7305h             |
| AL061   | Encoder undervoltage                               | 7305h             |

## 12

| Display | Alarm name  | 16-bit error code |
|---------|---|-------------------|
| AL062   | Number of revolutions of the absolute encoder overflows (issued by encoder)               | 7305h             |
| AL064   | Encoder vibration warning   | 7305h             |
| AL066   | Number of revolutions of the absolute encoder overflows (issued by servo drive)           | 7305h             |
| AL067   | Encoder temperature warning   | 7305h             |
| AL068   | Absolute data transmitted by I/O is in error  | 7305h             |
| AL069   | Wrong motor type  | 0000h             |
| AL06A   | Absolute position is lost   | 7305h             |
| AL06B   | The error between the servo drive internal position and the encoder position is too large | 7305h             |
| AL06E   | Encoder type is unidentifiable  | 7305h             |
| AL06F   | The absolute position is not established  | 7305h             |
| AL070   | Encoder did not complete the read / write procedure                                       | 7305h             |
| AL071   | Number of revolutions of the encoder is in error  | 7305h             |
| AL072   | Encoder overspeed   | 7305h             |
| AL073   | Encoder memory error  | 7305h             |
| AL074   | Encoder single-turn absolute position is in error   | 7305h             |
| AL075   | Encoder absolute number of revolutions is in error  | 7305h             |
| AL077   | Encoder internal error  | 7305h             |
| AL079   | Encoder parameter setting incomplete  | 7305h             |
| AL07A   | Encoder Z phase position is lost  | 7305h             |
| AL07B   | Encoder memory is busy  | 7305h             |
| AL07C   | Command to clear the absolute position is issued when the motor speed is over 200 rpm     | 7305h             |
| AL07D   | Motor stops operating when servo drive power is cycled before AL07C is cleared            | 7305h             |
| AL07E   | Error occurs when the encoder clears the procedure  | 7305h             |
| AL07F   | Encoder version error   | 7305h             |
| AL083   | Servo drive outputs excessive current   | 2310h             |
| AL085   | Regeneration setting error  | 3210h             |
| AL086   | Regenerative resistor overload  | 3110h             |
| AL088   | Servo function operational alarm  | 0000h             |
| AL089   | Current detection interference  | 6100h             |
| AL08A   | Auto tuning function - command error  | 7305h             |
| AL08B   | Auto tuning function - dwell time is too short  | 7305h             |
| AL08C   | Auto tuning function - inertia estimation error   | 7305h             |
| AL099   | DSP firmware error  | 5500h             |
| AL09C   | Parameter reset failed  | 5500h             |
| AL09F   | Capacitor charging error  | 0000h             |
| AL0A6   | Absolute positions of the servo drive and motor do not match                              | 7305h             |
| AL111   | Buffer overflow occurs when SDO is received   | 8110h             |
| AL112   | Buffer overflow occurs when PDO is received   | 8110h             |
| AL113   | TxPDO transmission failed   | 8110h             |
| AL121   | Object's index does not exist when PDO is accessed  | 8200h             |
| AL122   | Object's sub-index does not exist when PDO is accessed                                    | 8200h             |
| AL123   | Data length error occurs when PDO is accessed   | 8200h             |
| AL124   | Data range error occurs when PDO is accessed  | 8200h             |

| Display | Alarm name  | 16-bit error code |
|---------|---|-------------------|
| AL125   | PDO object is read-only and write-protected                                 | 8200h             |
| AL126   | Specified object does not support PDO mapping                               | 8200h             |
| AL127   | PDO object is write-protected when servo drive is on                        | 8200h             |
| AL128   | Error occurs when PDO object is read from EEPROM                            | 8200h             |
| AL129   | Error occurs when PDO object is written to EEPROM                           | 8200h             |
| AL130   | Accessing address of EEPROM is out of range                                 | 8200h             |
| AL131   | EEPROM CRC calculation error  | 8200h             |
| AL132   | Parameter is write-protected  | 8200h             |
| AL170   | Bus communication timeout   | 8130h             |
| AL180   | Bus communication timeout   | 8130h             |
| AL185   | Bus hardware error  | 8120h             |
| AL186   | Bus data transmission error   | 8100h             |
| AL201   | Initialization error of object dictionary data                              | 6310h             |
| AL207   | Parameter group of Type [8] PR is out of range                              | 0207h             |
| AL209   | Parameter number of Type [8] PR is out of range                             | 0209h             |
| AL211   | Parameter format setting of Type [8] PR is in error                         | 0211h             |
| AL213   | Parameter setting of Type [8] PR is in error                                | 0213h             |
| AL215   | Parameter written by Type [8] PR is read-only                               | 0215h             |
| AL217   | Parameter written by Type [8] PR is write-protected when Servo On           | 0217h             |
| AL219   | Parameter written by Type [8] PR is write-protected                         | 0219h             |
| AL231   | Monitoring variable code specified by Type [8] PR is out of range           | 0231h             |
| AL235   | Position counter overflow warning   | 0235h             |
| AL237   | Rotary axis position is undefined   | 0237h             |
| AL245   | PR positioning timeout  | 0245h             |
| AL249   | PR path number is out of range  | 0249h             |
| AL283   | Software positive limit   | 5444h             |
| AL285   | Software negative limit   | 5445h             |
| AL289   | Position counter overflows  | 7305h             |
| AL301   | CANopen synchronization failure   | 6200h             |
| AL302   | Synchronization signal of CANopen is sent too soon                          | 6200h             |
| AL303   | CANopen synchronization signal timeout                                      | 6200h             |
| AL304   | Invalid interpolation mode command  | 6200h             |
| AL305   | SYNC period error   | 6200h             |
| AL35F   | Emergency stop during deceleration  | 6200h             |
| AL380   | Position offset alarm for DO.MC_OK  | 6200h             |
| AL3CF   | Emergency stop  | 6200h             |
| AL3E1   | Communication fails to synchronize  | 6200h             |
| AL3E2   | Communication synchronization signal is sent too soon                       | 6200h             |
| AL3E3   | Communication synchronization signal timeout                                | 6200h             |
| AL3F1   | Absolute position command of the communication type servo drive is in error | 6200h             |
| AL400   | Rotary axis position setting error  | FF05h             |
| AL401   | NMT reset command is received when servo is on                              | 0000h             |
| AL404   | PR special filter setting value is too great                                | FF07h             |
| AL422   | Write-in failed caused by power supply cut-off                              | 0000h             |
| AL500   | STO function is enabled   | 9000h             |

## 12

| Display | Alarm name   | 16-bit error code |
|---------|--|-------------------|
| AL501   | SF1 lost (signal loss or signal error)                           | 9000h             |
| AL502   | SF2 lost (signal loss or signal error)                           | 9000h             |
| AL503   | STO self-diagnostic error  | 9000h             |
| AL510   | Internal parameter update program of the servo drive is abnormal | 0000h             |
| AL520   | Calculation program timeout                                      | 0000h             |
| AL521   | Vibration elimination parameter error                            | 6100h             |
| AL555   | System failure   | -                 |
| AL809   | PR motion setting error or command decoding error                | 0000h             |
| ALC31   | Motor power cable disconnection                                  | 3300h             |
| ALCDB   | Servo drive model type error                                     | 0000h             |
