# 1 Safety Precautions

Please read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the inverter. If ignored, physical injury or death may occur, or damage may occur to the devices.

If any physical injury or death or damage to the devices occurs due to neglect of the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

## 1.1 Safety definition

|                         |                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Danger:                 | Serious physical injury or even death may occur if related requirements are not followed                                                                                                                                                                           |
| Warning:                | Physical injury or damage to the devices may occur if related requirements are not followed                                                                                                                                                                        |
| Note:                   | Physical hurt may occur if related requirements are not followed                                                                                                                                                                                                   |
| Qualified electricians: | People working on the device should take part in professional electrical and safety training, receive the certification and be familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to avoid any emergency. |

## 1.2 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual:

| Symbols                                                                                      | Name                    | Instruction                                                                                 | Abbreviation                                                                        |
|----------------------------------------------------------------------------------------------|-------------------------|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  Danger      | Danger                  | Serious physical injury or even death may occur if related requirements are not followed    |    |
|  Warning   | Warning                 | Physical injury or damage to the devices may occur if related requirements are not followed |  |
|  No touch  | Electrostatic discharge | Damage to the PCBA board may occur if related requirements are not followed                 |  |
|  Hot sides | Hot sides               | Sides of the device may become hot. Do not touch.                                           |  |
| <b>Note</b>                                                                                  | Note                    | Physical hurt may occur if related requirements are not followed                            | Note                                                                                |

### 1.3 Safety guidelines

|  | <p>⚡ Only qualified electricians are allowed to operate on the inverter.</p> <p>⚡ Do not carry out wiring, inspection or component replacement when the power supply is applied. Ensure all input power supply is disconnected before wiring and checking and always wait for at least the time designated on the inverter or until the DC bus voltage is less than 36V. The table below describes the waiting time:</p> <table><tr><th colspan="2">Inverter module</th><th>Minimum waiting time</th></tr><tr><td>1PH 230V</td><td>0.4kW-2.2kW</td><td>5 minutes</td></tr><tr><td>3PH 230V</td><td>0.4kW-7.5kW</td><td>5 minutes</td></tr><tr><td>3PH 400V</td><td>0.75kW-110kW</td><td>5 minutes</td></tr></table> | Inverter module      |  | Minimum waiting time | 1PH 230V | 0.4kW-2.2kW | 5 minutes | 3PH 230V | 0.4kW-7.5kW | 5 minutes | 3PH 400V | 0.75kW-110kW | 5 minutes |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--|----------------------|----------|-------------|-----------|----------|-------------|-----------|----------|--------------|-----------|
| Inverter module                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Minimum waiting time |  |                      |          |             |           |          |             |           |          |              |           |
| 1PH 230V                                                                         | 0.4kW-2.2kW                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 5 minutes            |  |                      |          |             |           |          |             |           |          |              |           |
| 3PH 230V                                                                         | 0.4kW-7.5kW                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 5 minutes            |  |                      |          |             |           |          |             |           |          |              |           |
| 3PH 400V                                                                         | 0.75kW-110kW                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 5 minutes            |  |                      |          |             |           |          |             |           |          |              |           |
|  | <p>⚡ Do not refit the inverter unless authorized; otherwise, fire, electric shock or other injury may occur.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                      |  |                      |          |             |           |          |             |           |          |              |           |
|  | <p>⚡ The base of the radiator may become hot during running. Do not touch to avoid hurt.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                      |  |                      |          |             |           |          |             |           |          |              |           |
|  | <p>⚡ The electrical parts and components inside the inverter are electrostatic. Take measures to avoid electrostatic discharge during related operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                      |  |                      |          |             |           |          |             |           |          |              |           |

#### 1.3.1 Delivery and installation

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>⚡ Please install the inverter on fire-retardant material and keep the inverter away from combustible materials.</p> <p>⚡ Connect the braking optional parts (braking resistors, braking units or feedback units) according to the wiring diagram.</p> <p>⚡ Do not operate on the inverter if there is any damage or components loss to the inverter.</p> <p>⚡ Do not touch the inverter with wet items or body; otherwise, electric shock may occur.</p> |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Note:

- ⚡ Select appropriate moving and installing tools to ensure a safe and normal running of the inverter and avoid physical injury or death. For physical safety, the erector should take some mechanical protective measures, such as wearing exposure shoes and working uniforms.
- ⚡ Ensure to avoid physical shock or vibration during delivery and installation.
- ⚡ Do not carry the inverter by its cover. The cover may fall off.
- ⚡ Install away from children and other public places.
- ⚡ The inverter cannot meet the requirements of low voltage protection in IEC61800-5-1 if the altitude of installation site is above 2000m.
- ⚡ The leakage current of the inverter may be above 3.5mA during operation. Ground properly and ensure the grounding resistor is less than 10Ω. The conductivity of PE

grounding conductor is the same as that of the phase conductor (with the same cross sectional area).

- ✧ R, S and T are the input terminals of the power supply, while U, V and W are the motor terminals. Please connect the input power cables and motor cables properly; otherwise, the damage to the inverter may occur.

### 1.3.2 Commissioning and running

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply.</li> <li>✧ High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting.</li> <li>✧ The inverter may start up by itself when P01.21=1. Do not get close to the inverter and motor.</li> <li>✧ The inverter cannot be used as “Emergency-stop device”.</li> <li>✧ The inverter cannot be used to brake the motor suddenly. A mechanical braking device should be provided.</li> </ul> |
|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Note:

- ✧ Do not switch on or off the input power supply of the inverter frequently.
- ✧ For inverters that have been stored for a long time, check and fix the capacitance and try to run it again before application (see chapter **6 Fault tracking**).
- ✧ Close the front board before running; otherwise, electric shock may occur.

### 1.3.3 Maintenance and replacement of components

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ Only qualified electricians are allowed to perform the maintenance, inspection, and components replacement of the inverter.</li> <li>✧ Disconnect all power supplies to the inverter before the terminal wiring. Wait for at least the time designated on the inverter after disconnection.</li> <li>✧ Take measures to avoid screws, cables and other conductive matters to fall into the inverter during maintenance and component replacement.</li> </ul> |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Note:

- ✧ Please select proper torque to tighten screws.
- ✧ Keep the inverter, parts and components away from combustible materials during maintenance and component replacement.
- ✧ Do not carry out any isolation and pressure test on the inverter and do not measure the control circuit of the inverter by megameter.

### 1.3.4 Scrap treatment

|                                                                                    |                                                                                                                                  |
|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ There are heavy metals in the inverter. Deal with it as industrial effluent.</li> </ul> |
|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|

- ✧ When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point instead of placing it in the normal waste stream.

## 2 Product Overview

### 2.1 Quick start-up

#### 2.1.1 Unpacking inspection

Check as follows after receiving products:

|                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Check whether the packing box is damaged or dampened. If yes, contact local dealers or Universal Motors.                                                                                                         |
| 2. Check the model identifier on the exterior surface of the packing box is consistent with the purchased model. If no, contact local dealers or Universal Motors.                                                  |
| 3. Check whether the interior surface of packing box is abnormal, for example, in wet condition, or whether the enclosure of the inverter is damaged or cracked. If yes, contact local dealers or Universal Motors. |
| 4. Check whether the nameplate of the inverter is consistent with the model identifier on the exterior surface of the packing box. If no, contact local dealers or Universal Motors.                                |
| 5. Check whether the accessories (including user's manual and control keypad) inside the packing box are complete. If not, please contact local dealers or Universal Motors.                                        |

#### 2.1.2 Application confirmation

Check the machine before beginning to use the inverter:

|                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Check the load type to verify that there is no overload of the inverter during work and check that whether the drive needs to modify the power degree. |
| 2. Check that the actual current of the motor is less than the rated current of the inverter.                                                             |
| 3. Check that the control accuracy of the load is the same of the inverter.                                                                               |
| 4. Check that the incoming supply voltage is correspondent to the rated voltage of the inverter.                                                          |

#### 2.1.3 Environment

Check as follows before the actual installation and usage:

|                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Check that the ambient temperature of the inverter is below 40°C. If the ambient temperature exceeds 40°C, derate 1% for every additional 1°C. In addition, the inverter cannot be used in the ambient temperature above 50°C.<br><b>Note:</b> For the cabinet inverter, the ambient temperature means the air temperature inside the cabinet. |
| 2. Check that the ambient temperature of the inverter in actual usage is above -10°C. If not, add heating facilities.<br><b>Note:</b> for the cabinet inverter, the ambient temperature means the air temperature inside the cabinet.                                                                                                             |
| 3. Check whether the altitude of the actual application site is below 1000m. If not, derate 1% for every additional 100m.                                                                                                                                                                                                                         |
| 4. Check that the humidity of the actual usage site is below 90% and condensation is not allowed. If not, add additional protection to the inverter.                                                                                                                                                                                              |

5. Check that the actual usage site is away from direct sunlight and foreign objects cannot enter the inverter. If not, add additional protective measures.
6. Check that there is no conductive dust or flammable gas in the actual usage site. If not, add additional protection to the inverter.

### 2.1.4 Installation confirmation

Check as follows after the installation:

1. Check that the load range of the input and output cables meet the need of actual load.
2. Check that the accessories of the inverter are installed correctly and properly. The installation cables should meet the needs of every component (including reactors, input filters, output reactors, output filters, DC reactors, braking units and braking resistors).
3. Check that the inverter is installed on non-flammable materials and the calorific accessories (reactors and brake resistors) are away from flammable materials.
4. Check that all control cables and power cables are routed separately and the wire layout complies with EMC requirement.
5. Check that all grounding systems are properly grounded according to the requirements of the inverter.
6. Check that the free space during installation is sufficient according to the instructions in user's manual.
7. Check that the installation conforms to the instructions in user's manual. The drive must be installed in an upright position.
8. Check that the external connection terminals are tightly fastened and the torque is appropriate.
9. Check that there are no screws, cables and other conductive items left in the inverter. If not, get them out.

### 2.1.5 Basic commissioning

Complete the basic commissioning as follows before actual utilization:

1. Autotune. If possible, de-coupled from the motor load to start dynamic autotune, or if not, static autotune is available.
2. Adjust the acceleration/deceleration time according to the actual running of the load.
3. Commissioning the device via jogging and check that the rotation direction is as required. If not, change the rotation direction by changing the wiring of motor.
4. Set all control parameters before operation.

## 2.2 Product specification

| Function    |                      | Specification                                                                                      |
|-------------|----------------------|----------------------------------------------------------------------------------------------------|
| Power input | Input voltage (V)    | AC 1PH 230V(-15%) – 240V(+10%)<br>AC 3PH 230V(-15%) – 240V(+10%)<br>AC 3PH 400V(-15%) – 440V(+10%) |
|             | Input current (A)    | Refer to section <b>2.5 Rated value</b>                                                            |
|             | Input frequency (Hz) | 50Hz or 60Hz; Allowed range: 47 – 63Hz                                                             |

| Function                  |                                        | Specification                                                                                                                                                                                                   |
|---------------------------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power output              | Output voltage (V)                     | 0 – input voltage                                                                                                                                                                                               |
|                           | Output current (A)                     | Refer to section <b>2.5 Rated value</b>                                                                                                                                                                         |
|                           | Output power (kW)                      | Refer to section <b>2.5 Rated value</b>                                                                                                                                                                         |

## 2.3 Nameplate

Figure 2-1 Nameplate

**Note:** This is the example for the standard products. The CE/TUV/IP20 will be marked according to the actual certification condition.

## 2.4 Type designation key

The type designation contains information on the inverter. Users can find the type designation on the type designation label attached to the inverter or the nameplate.

## 2.6 Structure diagram

Below is the layout figure of the inverter (Three phase 400V,  $\leq 2.2\text{kW}$ ) (take the inverter of 0.75kW as the example).

Figure 2-3 Product structure (Three phase 400V,  $\leq 2.2\text{kW}$ )

| No. | Name                 | Illustration                              |
|-----|----------------------|-------------------------------------------|
| 1   | External keypad port | Connect the external keypad               |
| 2   | Port cover           | Protect the external keypad port          |
| 3   | Cover                | Protect the internal parts and components |

| No. | Name                       | Illustration                                                                                                           |
|-----|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| 4   | Hole for the sliding cover | Fix the sliding cover                                                                                                  |
| 5   | Trunking board             | Protect the inner components and fix the cables of the main circuit                                                    |
| 6   | Nameplate                  | See chapter <b>2 Product Overview</b> for details                                                                      |
| 7   | Potentiometer knob         | Refer to chapter <b>4 Keypad Operation Procedure</b>                                                                   |
| 8   | Control terminals          | See chapter <b>3 Installation guidelines</b> for details                                                               |
| 9   | Main circuit terminals     | See chapter <b>3 Installation guidelines</b> for details                                                               |
| 10  | Screw hole                 | Fix the fan cover and fan                                                                                              |
| 11  | Cooling fan                | See chapter <b>6 Fault tracking</b> for details                                                                        |
| 12  | Fan cover                  | Protect the fan                                                                                                        |
| 13  | Bar code                   | The same as the bar code on the nameplate<br><b>Note:</b> The bar code is on the middle shell which is under the cover |

**Note:** In above figure, the screws at 4 and 10 are provided with packaging and specific installation depends on the requirements of customers.

Below is the layout figure of the inverter (Three phase 400V,  $\geq 4\text{kW}$ ) (take the inverter of 4kW as the example).

Figure 2-3 Product structure (Three phase 400V,  $\geq 4\text{kW}$ )

| No. | Name                 | Illustration                                         |
|-----|----------------------|------------------------------------------------------|
| 1   | External keypad port | Connect the external keypad                          |
| 2   | Cover                | Protect the internal parts and components            |
| 3   | Keypad               | Refer to chapter <b>4 Keypad Operation Procedure</b> |
| 4   | Cooling fan          | See chapter <b>6 Fault tracking</b> for details      |

| No. | Name                                | Illustration                                                                                                                          |
|-----|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 6   | Cover for the heat emission hole    | Optional, enhancement of the protective degree. It is necessary to derate the inverter because the internal temperature is increasing |
| 7   | Control terminals                   | See chapter <b>3 Installation guidelines</b> for details                                                                              |
| 8   | Main circuit terminals              | See chapter <b>3 Installation guidelines</b> for details                                                                              |
| 9   | The cable entry of the main circuit | Fix the cables                                                                                                                        |
| 10  | Simple nameplate                    | Refer to section <b>2.4 Type Designation Key</b>                                                                                      |
| 11  | Bar code                            | The same as the bar code on the nameplate<br><b>Note:</b> The bar code is on the middle shell which is under the cover                |

## 3 Installation Guide

The chapter describes the mechanical installation and electric installation.

- ✧ Only qualified electricians are allowed to carry out what described in this chapter. Please operate as the instructions in chapter **1 Safety Precautions**. Ignoring these safety precautions may cause physical injury or death or damage to the devices.
- ✧ Ensure the power supply of the inverter is disconnected during the operation. Wait for at least the time designated after the disconnection if the power supply is applied.
- ✧ The installation and design of the inverter should be complied with the requirement of the local laws and regulations in the installation site. If the installation infringes the requirement, our company will exempt from any responsibility. Additionally, if users do not comply with the suggestion, some damage beyond the assured maintenance range may occur.

### 3.1 Mechanical installation

#### 3.1.1 Installation environment

The installation environment is the safeguard for a full performance and long-term stable functions of the inverter. Check the installation environment as follows:

| Environment             | Conditions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Installation site       | Indoor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Environment temperature | <p>-10°C to +50°C, and the temperature changing rate is less than 0.5°C/minute. If the ambient temperature of the inverter is above 40°C, derate 1% for every additional 1°C.</p> <p>It is not recommended to use the inverter if the ambient temperature is above 50°C.</p> <p>In order to improve the reliability of the device, do not use the inverter if the ambient temperature changes frequently.</p> <p>Please provide cooling fan or air conditioner to control the internal ambient temperature below the required one if the inverter is used in a close space such as in the control cabinet.</p> <p>When the temperature is too low, if the inverter needs to restart to run after a long stop, it is necessary to provide an external heating device to increase the internal temperature; otherwise, damage to the devices may occur.</p> |
| Humidity                | <p>RH≤90%</p> <p>No condensation is allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Storage temperature     | -40°C to +70°C, and the temperature changing rate is less than 1°C/minute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Running                 | The installation site of the inverter should fulfill the following requirements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Environment            | Conditions                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environment condition  | a) Away from the electromagnetic radiation source;<br>b) Away from contaminative air, such as corrosive gas, oil mist and flammable gas;<br>c) Foreign objects, such as metal power, dust, oil, water cannot fall into the inverter (do not install the inverter on the flammable materials such as wood);<br>d) Away from direct sunlight, oil mist, steam and vibration environment. |
| Altitude               | Below 1000m;<br>If the altitude is above 1000m, derate 1% for every additional 100m.                                                                                                                                                                                                                                                                                                   |
| Vibration              | $\leq 5.8\text{m/s}^2$ (0.6g)                                                                                                                                                                                                                                                                                                                                                          |
| Installation direction | The inverter should be installed on an upright position to ensure sufficient cooling effect.                                                                                                                                                                                                                                                                                           |

**Note:**

- ◆ Goodrive20 series inverters should be installed in a clean and ventilated environment according to enclosure classification.
- ◆ Cooling air must be clean, free from corrosive materials and electrically conductive dust.

**3.1.2 Installation direction**

The inverter may be installed on the wall or in a cabinet.

The inverter needs be installed in the vertical position. Check the installation site according to the requirements below. Refer to **Appendix B Dimension Drawings** for details.

**3.1.3 Installation mode**

(1) Wall and rail mounting for the inverters (single phase 230V/three phase 400V,  $\leq 2.2\text{KW}$  and three phase 230V,  $\leq 0.75\text{KW}$ )

Figure 3-1 Installation

**Note:** the minimum space of A and B is 100mm if H is 36.6mm and W is 35.0mm.

(2) Wall and flange mounting for the inverters (three phase 400V,  $\geq 4\text{KW}$  and three phase 230V,  $\geq 1.5\text{KW}$ )

Figure 3-2 Installation

- (1) Locate the position of the installation hole.
- (2) Fix the screw or nut on the located position.
- (3) Put the inverter against the wall.
- (4) Tighten up the screws.

## 3.2 Standard wiring

### 3.2.1 Connection diagram of main circuit

Figure 3-3 Connection diagram of main circuit

#### Note:

- ◆ The fuse, braking resistor, input reactor, input filter, output reactor, output filter are optional parts. Please refer to **Peripheral Optional Parts** for detailed information.
- ◆ Remove the yellow warning labels of PB, (+) and (-) on the terminals before connecting the braking resistor; otherwise, poor connection may be occur.

### 3.2.2 Terminals figure of main circuit

Figure 3-4 1PH terminals of main circuit (single phase)

Figure 3-5 3PH terminals of main circuit (230V,  $\leq 0.75\text{kW}$ , and 400V,  $\leq 2.2\text{kW}$ )

Figure 3-6 3PH terminals of main circuit (230V,  $\leq 1.5\text{kW}$ , and 400V, 4-22kW)

Figure 3-7 3PH terminals of main circuit (30-37kW)

Figure 3-8 3PH terminals of main circuit (45-110kW)

| Terminal | Function                                                               |
|----------|------------------------------------------------------------------------|
| L, N     | Single phase AC input terminals, connected to the power supply.        |
| R, S, T  | Three phase AC input terminals, connected to the power supply.         |
| PB, (+)  | External dynamic braking resistor terminal                             |
| (+), (-) | Input terminal of the DBU or DC bus                                    |
| U, V, W  | Three phase AC input terminals which are generally connected to motor. |
| PE       | Protective grounding terminal                                          |

**Note:**

- ◆ Do not use asymmetrically motor cables. If there is a symmetrically grounding conductor in the motor cable in addition to the conductive shield, connect the grounding conductor to the grounding terminal at the inverter and motor ends.
- ◆ Route the motor cable, input power cable and control cables separately.

**3.2.3 Wiring of terminals in main circuit**

1. Connect the ground line of input power cable to the ground terminal of inverter (PE) directly, and connect 3PH input cable to R, S and T and fasten up.
2. Connect the ground line of motor cable to the ground terminal of the inverter, and connect the 3PH motor cable to U, V, W and fasten up.
3. Connect the brake resistor which carries cables to the designated position.
4. Fasten up all the cables on the outside of the inverter if allowed.

**3.2.4 Wiring diagram of control circuit**

Figure 3-9 Wiring of control circuit

**3.2.5 Terminals of control circuit**Fig 3-10 Connection terminal diagram for inverters  $\leq 2.2\text{kW}$

Fig 3-11 Connection terminal diagram for inverters  $\geq 4\text{kW}$ 

| Type                 | Terminal name | Function description                | Technical specifications                                                                                                                                                                                                                                                                                                                          |

|              | RO2A          | Relay 2 NO contact      |                                                                                                                                                                                                                                                                                                                         |
|              | RO2B          | Relay 2 NC contact      |                                                                                                                                                                                                                                                                                                                         |
|              | RO2C          | Relay 2 common contact  |                                                                                                                                                                                                                                                                                                                         |

### 3.2.6 Input/output signal connection figure

Please use U-shaped contact tag to set NPN mode or PNP mode and the internal or external power supply. The default setting is NPN internal mode.

Figure 3-12 U-shaped contact tag

If the signal is from NPN transistor, please set the U-shaped contact tag between +24V and PW as below according to the used power supply.

Figure 3-13 NPN modes

If the signal is from PNP transistor, please set the U-shaped contact tag as below according to the used power supply.

Figure 3-14 PNP modes

### 3.3 Overview of STO function

Reference standards: IEC 61508-1, IEC 61508-2, IEC 61508-3, IEC 61508-4, IEC 62061, ISO 13849-1, IEC 61800-5-2.

The STO function can be used where main power of the drive is on to prevent unexpected start. The function cuts off the drive signal to disable the drive output, thus preventing motor

from unexpected start (refer to below figure). After enabling STO function, short-time operations (like non-electrical cleaning-up in lathe industry) and/or maintenance on non-electrical parts can be conducted.

### 3.3.1 Logic table for STO function

Input states and corresponding faults of STO function:

| STO input state                 | Corresponding STO fault                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H1, H2 opens simultaneously     | Trigger STO function, the drive can't operate normally                                                                                                                                           |
| H1, H2 closes simultaneously    | Don't trigger STO function, the drive can operate normally                                                                                                                                       |
| Either H1 or H2 opens or closes | Trigger STL1/STL2/STL3 fault, fault code:<br>38: Safety circuit of channel 1 is abnormal (STL1)<br>39: Safety circuit of channel 2 is abnormal (STL2)<br>40: Internal circuit is abnormal (STL3) |

### 3.3.2 Description of STO channel delay

STO channel trigger and indication delay time:

| STO mode        | STO trigger and indication delay <sup>1, 2)</sup> |
|-----------------|---------------------------------------------------|
| STO fault: STL1 | Trigger delay < 10ms, Indication delay < 280ms    |
| STO fault: STL2 | Trigger delay < 10ms, Indication delay < 280ms    |
| STO fault: STL3 | Trigger delay < 10ms, Indication delay < 280ms    |
| STO fault: STO  | Trigger delay < 10ms, Indication delay < 100ms    |

<sup>1)</sup> STO trigger delay = the delay between triggering STO and cutting off drive output

<sup>2)</sup> STO indication delay = the delay between triggering STO and indicating STO output state

### 3.3.3 Self-inspection on STO installation

Before installing STO, please perform self-inspection according to below table to ensure the effectiveness of STO.

|                          | Actions                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <input type="checkbox"/> | Ensure that the drive can be run and stopped freely during commissioning.                                                                                                                                                                                                                                                                                                          |
| <input type="checkbox"/> | Stop the drive (if running), cut off input power and isolate the drive from the power cable via the switch                                                                                                                                                                                                                                                                         |
| <input type="checkbox"/> | Check STO circuit connection against circuit diagram.                                                                                                                                                                                                                                                                                                                              |
| <input type="checkbox"/> | Check that the shield of STO input cable is connected to +24V reference GND COM                                                                                                                                                                                                                                                                                                    |
| <input type="checkbox"/> | Power on                                                                                                                                                                                                                                                                                                                                                                           |
| <input type="checkbox"/> | Test the operation of STO when the motor is stopped: <ul style="list-style-type: none"> <li>▪ Give a stop command to the drive (if running) and wait until the motor shaft is at standstill.</li> <li>▪ Activate STO function and give a start command to the drive, ensure the motor stays at standstill</li> <li>▪ Inactivate STO circuit</li> </ul>                             |
| <input type="checkbox"/> | Restart the drive and check if the motor runs normally                                                                                                                                                                                                                                                                                                                             |
| <input type="checkbox"/> | Test the operation of STO function when the motor is running: <ul style="list-style-type: none"> <li>▪ Start the drive and ensure the motor runs normally.</li> <li>▪ Activate STO circuit.</li> <li>▪ The drive reports STO fault (refer to fault and countermeasure in page X), ensure that motor coast to stop and stops rotation.</li> <li>▪ Inactivate STO circuit</li> </ul> |
| <input type="checkbox"/> | Restart the drive and check if the motor runs normally                                                                                                                                                                                                                                                                                                                             |

### 3.4 Layout protection

#### 3.4.1 Protecting the inverter and input power cable in short-circuit situations

Protect the inverter and input power cable in short circuit situations and against thermal overload.

Arrange the protection according to the following guidelines.

Figure 3-15 Fuse configuration

**Note:** Select the fuse as the manual indicated. The fuse will protect the input power cable from damage in short-circuit situations. It will protect the surrounding devices when the internal of the inverter is short circuited.

#### 3.4.2 Protecting the motor and motor cables

The inverter protects the motor and motor cable in a short-circuit situation when the motor

cable is dimensioned according to the rated current of the inverter. No additional protection devices are needed.

✧ **If the inverter is connected to multiple motors, a separate thermal overload switch or a circuit breaker must be used for protecting each cable and motor. These devices may require a separate fuse to cut off the short-circuit current.**

### 3.4.3 Implementing a bypass connection

It is necessary to set power frequency and variable frequency conversion circuits for the assurance of continuous normal work of the inverter if faults occur in some significant situations.

In some special situations, for example, if it is only used in soft start, the inverter can be converted into power frequency running after starting and some corresponding bypass should be added.

✧ **Never connect the supply power to the inverter output terminals U, V and W. Power line voltage applied to the output can result in permanent damage to the inverter.**

If frequent shifting is required, employ mechanically connected switches or contactors to ensure that the motor terminals are not connected to the AC power line and inverter output terminals simultaneously.

## 4 Keypad Operation Procedure

### 4.1 Keypad introduction

The keypad is used to control Goodrive20 series inverters, read the state data and adjust parameters.

Figure 4-1 Film keypad

Figure 4-2 External keypad

**Note:**

1. The film keypad is standard for the inverters of 1PH 230V/3PH 400V ( $\leq 2.2\text{kW}$ ) and the inverters of 3PH ( $\leq 0.75\text{kW}$ ). The external keypad is standard for the inverters of 3PH 400V ( $\geq 4\text{kW}$ ) and 3PH 230V ( $\geq 1.5\text{kW}$ ).
2. The external keypads are optional (including the external keypads with and without the function of parameter copying).

| No. | Name      | Description                                                                         |                                                                                           |

(only for the inverters≤2.2kW)                                                                                                                                                    |                 |                                                                                                                                                                  |   |   |   |

## 4.2 Keypad displaying

The keypad displaying state of Goodrive20 series inverters is divided into stopping state

parameter, running state parameter, function code parameter editing state and fault alarm state and so on.

#### 4.2.1 Displayed state of stopping parameter

When the inverter is in the stopping state, the keypad will display stopping parameters which is shown in figure 4-2.

In the stopping state, various kinds of parameters can be displayed. Select the parameters to be displayed or not by P07.07. See the instructions of P07.07 for the detailed definition of each bit.

In the stopping state, there are 14 stopping parameters can be selected to be displayed or not. They are: set frequency, bus voltage, input terminals state, output terminals state, PID given, PID feedback, torque set value, AI1, AI2, AI3, HDI, PLC and the current stage of multi-step speeds, pulse counting value, length value. P07.07 can select the parameter to be displayed or not by bit and **▶/SHIFT** can shift the parameters from left to right, **QUICK/JOG** (P07.02=2) can shift the parameters from right to left.

#### 4.2.2 Displayed state of running parameters

After the inverter receives valid running commands, the inverter will enter into the running state and the keypad will display the running parameters. **RUN/TUNE** LED on the keypad is on, while the **FWD/REV** is determined by the current running direction which is shown as figure 4-2.

In the running state, there are 24 parameters can be selected to be displayed or not. They are: running frequency, set frequency, bus voltage, output voltage, output torque, PID given, PID feedback, input terminals state, output terminals state, torque set value, length value, PLC and the current stage of multi-step speeds, pulse counting value, AI1, AI2, AI3, HDI, percentage of motor overload, percentage of inverter overload, ramp given value, linear speed, AC input current. P07.05 and P07.06 can select the parameter to be displayed or not by bit and **▶/SHIFT** can shift the parameters from left to right, **QUICK/JOG** (P07.02=2) can shift the parameters from right to left.

#### 4.2.3 Displayed state of fault

If the inverter detects the fault signal, it will enter into the fault pre-alarm displaying state. The keypad will display the fault code by flicking. The **TRIP** LED on the keypad is on, and the fault reset can be operated by the **STOP/RST** on the keypad, control terminals or communication commands.

#### 4.2.4 Displayed state of function codes editing

In the state of stopping, running or fault, press **PRG/ESC** to enter into the editing state (if there is a password, see P07.00). The editing state is displayed on two classes of menu, and the order is: function code group/function code number→function code parameter, press **DATA/ENT** into the displayed state of function parameter. On this state, press **DATA/ENT** to save the parameters or press **PRG/ESC** to escape.

Figure 4-3 Displayed state

### 4.3 Keypad operation

Operate the inverter via operation panel. See the detailed structure description of function codes in the brief diagram of function codes.

#### 4.3.1 How to modify the function codes of the inverter

The inverter has three levels menu, which are:

1. Group number of function code (first-level menu)
2. Tab of function code (second-level menu)
3. Set value of function code (third-level menu)

Remarks: Press both the **PRG/ESC** and the **DATA/ENT** can return to the second-level menu from the third-level menu. The difference is: pressing **DATA/ENT** will save the set parameters into the control panel, and then return to the second-level menu with shifting to the next function code automatically; while pressing **PRG/ESC** will directly return to the second-level menu without saving the parameters, and keep staying at the current function code code.

Under the third-level menu, if the parameter has no flickering bit, it means the function code cannot be modified. The possible reasons could be:

- 1) This function code is not modifiable parameter, such as actual detected parameter, operation records and so on;
- 2) This function code is not modifiable in running state, but modifiable in stop state.

Example: Set function code P00.01 from 0 to 1.

Figure 4-4 Sketch map of modifying parameters

#### 4.3.2 How to set the password of the inverter

Goodrive20 series inverters provide password protection function to users. Set P7.00 to gain the password and the password protection becomes valid instantly after quitting from

the function code editing state. Press **PRG/ESC** again to the function code editing state, "0.0.0.0.0" will be displayed. Unless using the correct password, the operators cannot enter it.

Set P7.00 to 0 to cancel password protection function.

The password protection becomes effective instantly after retreating from the function code editing state. Press **PRG/ESC** again to the function code editing state, "0.0.0.0.0" will be displayed. Unless using the correct password, the operators cannot enter it.

Figure 4-5 Sketch map of password setting

### 4.3.3 How to watch the inverter state through function codes

Goodrive20 series inverters provide group P17 as the state inspection group. Users can enter into P17 directly to watch the state.

Figure 4-6 Sketch map of state watching

## 5 Function Parameters

The function parameters of Goodrive20 series inverters have been divided into 30 groups (P00 – P29) according to the function, of which P18 – P28 are reserved. Each function group contains certain function codes applying 3-level menus. For example, “P08.08” means the eighth function code in the P8 group function, P29 group is factory reserved, and users are forbidden to access these parameters.

For the convenience of function codes setting, the function group number corresponds to the first level menu, the function code corresponds to the second level menu and the function code corresponds to the third level menu.

1. Below is the instruction of the function lists:

**The first column** “Function code”: codes of function parameter group and parameters;

**The second column** “Name”: full name of function parameters;

**The third column** “Detailed illustration of parameters”: Detailed illustration of the function parameters

**The fourth column** “Default value”: the original factory set value of the function parameter;

**The fifth column** “Modify”: the modifying character of function codes (the parameters can be modified or not and the modifying conditions), below is the instruction:

“○”: means the set value of the parameter can be modified on stop and running state;

“⊙”: means the set value of the parameter cannot be modified on the running state;

“●”: means the value of the parameter is the real detection value which cannot be modified.

The inverter needs to derate on high carrier frequency. At the same time, the leakage and electrical magnetic interference will increase. Applying low carrier frequency is contrary to the above, too low carrier frequency will cause unstable running, torque decreasing and surge.</p> | Carrier frequency   | Electro magnetic noise | Noise and leakage current | Heating eliminating | 1kHz | ↑ High | ↑ Low | ↑ Low | 10kHz |  |  |  | 15kHz | ↓ Low | ↓ High | ↓ High | Motor type | Factory setting of carrier frequency | 0.4 – 11kW | 8kHz | 15 – 110kW | 4kHz | Depend on model | ○ |

|               |                                       | FWD/REV terminal is valid, the inverter stop because of the stopping command from other sources, even the control terminal FWD/REV keeps valid; the inverter won't work when the stopping command is canceled. Only when FWD/REV is re-launched, the inverter can start again. For example, the valid STOP/RST stop when PLC signal cycles stop, fixed-length stop and terminal control (see P07.04). |               |        |

| P05.32        | Lower limit of AI1                              | <p>AI1 is set by the analog potentiometer, AI2 is set by control terminal AI2 and AI3 is set by control terminal AI3. The function code defines the relationship between the analog input voltage and its corresponding set value. If the analog input voltage beyond the set minimum or maximum input value, the inverter will count at the minimum or maximum one.</p> <p>When the analog input is the current input, the corresponding voltage of 0 – 20mA is 0 – 10V. In different cases, the corresponding rated value of 100.0% is different. See the application for detailed information.</p> <p>The figure below illustrates different applications:</p> | 0.00V         | <input type="radio"/> |

|               |                             | 100%, the adjusting range of PID adjustor is the max. frequency (ignoring integral function and differential function).<br>The setting range: 0.00 – 100.00                                                                                                                                                                                                                                                                                                                  |               |        |
| P09.05        | Integral time (Ti)          | This parameter determines the speed of PID adjustor to carry out integral adjustment on the deviation of PID feedback and reference. When the deviation of PID feedback and reference is 100%, the integral adjustor works continuously after the time (ignoring the proportional effect and differential effect) to achieve the max. frequency (P00.03) or the max. voltage (P04.31). Shorter the integral time, stronger is the adjustment<br>Setting range: 0.00 – 10.00s | 0.10s         | ○      |
| P09.06        | Differential time (Td)      | This parameter determines the strength of the change ratio when PID adjustor carries out integral adjustment on the deviation of PID feedback and reference. If the PID feedback changes 100% during the time, the adjustment of integral adjustor (ignoring the proportional effect and differential effect) is the max. frequency (P00.03) or the max. voltage (P04.31). Longer the integral time, stronger is the adjusting.<br>Setting range: 0.00 – 10.00s              | 0.00s         | ○      |
| P09.07        | Sampling cycle (T)          | This parameter means the sampling cycle of the feedback. The modulator calculates in each sampling cycle. The longer the sapling cycle is, the slower the response is.<br>Setting range: 0.001 – 10.000s                                                                                                                                                                                                                                                                     | 0.100s        | ○      |
| P09.08        | PID control deviation limit | The output of PID system is relative to the maximum deviation of the close loop reference. As shown in the diagram below, PID adjustor stops to work during the deviation limit. Set the function properly to adjust the accuracy and stability of the system.                                                                                                                                                                                                               | 0.0%          | ○      |

| P11.07        | Frequency-drop rate during current limit | During the running of the inverter, this function will detect the output current and compare it with the limit level defined in P11.06. If it exceeds the level, the inverter will run at stable frequency in accelerated running, or the inverter will derate to run during the constant running. If it exceeds the level continuously, the output frequency will keep on decreasing to the lower limit. If the output current is detected to be lower than the limit level, the inverter will accelerate to run. |      |      |      | 10.00 Hz/s    | ◎      |

## 6 Fault Tracking

### 6.1 Maintenance intervals

If installed in an appropriate environment, the inverter requires very little maintenance. The table lists the routine maintenance intervals recommended by Universal Motors.

| Item to be checked  |                 | Details                                                                                                                         | Check mode                             | Criterion                                                                                                                  |

### 6.1.1 Cooling fan

The inverter's cooling fan has a minimum life span of 25,000 operating hours. The actual life span depends on the inverter usage and ambient temperature.

The operating hours can be found through P07.14 (accumulative hours of the inverter).

Fan failure can be predicted by the increasing noise from the fan bearings. If the inverter is operated in a critical part of a process, fan replacement is recommended once these symptoms appear. Replacement fans are available from Universal Motors.

|  |                                                                                                                                                    |
|--|----------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ <b>Read and follow the instructions in chapter <i>Safety Precautions</i>. Ignoring the instructions would cause physical injury or death, or</b> |

|                                 |
|---------------------------------|
| <b>damage to the equipment.</b> |
|---------------------------------|

1. Stop the inverter and disconnect it from the AC power source and wait for at least the time designated on the inverter.
2. Lever the fan holder off the drive frame with a screwdriver and lift the hinged fan holder slightly upward from its front edge.
3. Disconnect the fan cable. Remove the installation bracket.
4. Install the bracket to the reversed direction. Pay attention the air direction of the inverter and the fan as the figure below:

Fan installation of the inverters 1PH, 230V,  $\leq 2.2\text{kW}$

Fan installation of the inverters 3PH, 400V,  $\geq 4\text{kW}$

### 6.1.2 Capacitors

#### Reforming the capacitors

The DC bus capacitors must be reformed according to the operation instruction if the inverter has been stored for a long time. The storing time is counted from the producing date other than the delivery data which has been marked in the serial number of the inverter.

| Time                          | Operational principle                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storing time less than 1 year | Operation without charging                                                                                                                                                                                                                                                                   |
| Storing time 1-2 years        | Connect to the power for 1 hour before first ON command                                                                                                                                                                                                                                      |
| Storing time 2-3 years        | Use power surge to charge for the inverter <ul style="list-style-type: none"> <li>• Apply 25% rated voltage for 30 minutes</li> <li>• Apply 50% rated voltage for 30 minutes</li> <li>• Apply 75% rated voltage for 30 minutes</li> <li>• Apply 100% rated voltage for 30 minutes</li> </ul> |

| Time                           | Operational principle                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storing time more than 3 years | Use power surge to charge for the inverter <ul style="list-style-type: none"> <li>• Apply 25% rated voltage for 2 hours</li> <li>• Apply 50% rated voltage for 2 hours</li> <li>• Apply 75% rated voltage for 2 hours</li> <li>• Apply 100% rated voltage for 2 hours</li> </ul> |

The method of using power surge to charge for the inverter:

The right selection of power surge depends on the supply power of the inverter. Single phase 230V AC/2A power surge applied to the inverter with single/three-phase 230V AC as its input voltage. The inverter with single/three-phase 230V AC as its input voltage can apply Single phase 230V AC/2A power surge (L+ to R and N to S or T). All DC bus capacitors charge at the same time because there is one rectifier.

High-voltage inverter needs enough voltage (for example, 400V) during charging. The small capacitor power (2A is enough) can be used because the capacitor nearly does not need current when charging.

### Change electrolytic capacitors

|                                                                                  |                                                                                                                                                                           |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ <b>Read and follow the instructions in chapter <i>Safety Precautions</i>. Ignoring the instructions may cause physical injury or death, or damage to the equipment.</b> |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Change electrolytic capacitors if the working hours of electrolytic capacitors in the inverter are above 35000. Please contact Universal Motors for detailed operation.

### 6.1.3 Power cable

|                                                                                  |                                                                                                                                                                           |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ <b>Read and follow the instructions in chapter <i>Safety Precautions</i>. Ignoring the instructions may cause physical injury or death, or damage to the equipment.</b> |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

1. Stop the drive and disconnect it from the power line. Wait for at least the time designated on the inverter.
2. Check the tightness of the power cable connections.
3. Restore power.

## 6.2 Fault solution

|                                                                                    |                                                                                                                                                                              |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ <b>Only qualified electricians are allowed to maintain the inverter. Read the safety instructions in chapter <i>Safety precautions</i> before working on the inverter.</b> |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 6.2.1 Alarm and fault indications

Fault is indicated by LEDs. See **Operation Procedure**. When **TRIP** light is on, an alarm or fault message on the panel display indicates abnormal inverter state. Using the information given in this chapter, most alarm and fault cause can be identified and corrected. If not, contact Universal Motors.

### 6.2.2 How to reset

The inverter can be reset by pressing the keypad key **STOP/RST**, through digital input, or by switching the power light. When the fault has been removed, the motor can be restarted.

### 6.2.3 Fault instruction and solution

Do as the following after the inverter fault:

1. Check to ensure there is nothing wrong with the keypad. If not, please contact Universal Motors.
2. If there is nothing wrong, please check P07 and ensure the corresponding recorded fault parameters to confirm the real state when the current fault occurs by all parameters.
3. See the following table for detailed solution and check the corresponding abnormal state.
4. Eliminate the fault and ask for relative help.
5. Check to eliminate the fault and carry out fault reset to run the inverter.

### STO alarm

- When the hundreds of P11.16 is set to 0, the STO alarm is locked.

As shown in below fig 1, When H1 and H2 are 'OFF' during operation (safety function is required), the drive enters safety mode and stops output. STO alarm will only be disappeared once reset action is valid. External running command need to be reset for the drive to execute running command again.

Fig 1

- When the hundreds of P11.16 is set to 1, the STO alarm will be unlocked

As shown in below fig 2, alarm unlock means when STO appears, the STO alarm will disappear automatically after state restoration, which requires no reset action. After reset of external running command, the drive will execute running command again.

Fig 2

### STL1 fault

As shown in below fig 3, when the hardware circuit of safety circuit 1 is abnormal while that of H2 signal is normal, namely, when H1 is abnormal during operation (safety function is required), the drive enters safety mode and stops output no matter whatever the running command is. Despite of reset commands and external running command reset, the drive will not execute running command again, and it is STL1 alarm lock all the time.

Fig 3

### STL2 fault

As shown in below fig 4, when the hardware circuit of safety circuit 2 is abnormal while that of H1 signal is normal, namely, when H2 is abnormal during operation (safety function is required), the drive enters safety mode and stops output no matter whatever the running command is. Despite of reset commands and external running command reset, the drive will not execute running command again, and it is STL2 alarm lock all the time.

|------------|------------------|------------------------------------|----------------|
| PoFF       | System power off | System power off or low DC voltage | Check the grid |

## 7 Communication Protocol

### 7.1 Brief instruction to Modbus protocol

Modbus protocol is a software protocol and common language which is applied in the electrical controller. With this protocol, the controller can communicate with other devices via network (the channel of signal transmission or the physical layer, such as RS485). And with this industrial standard, the controlling devices of different manufacturers can be connected to an industrial network for the convenient of being monitored.

There are two transmission modes for Modbus protocol: ASCII mode and RTU (Remote Terminal Units) mode. On one Modbus network, all devices should select same transmission mode and their basic parameters, such as baud rate, digital bit, check bit, and stopping bit should have no difference.

Modbus network is a controlling network with single-master and multiple slaves, which means that there is only one device performs as the master and the others are the slaves on one Modbus network. The master means the device which has active talking right to send message to Modbus network for the controlling and inquiring to other devices. The slave means the passive device which sends data message to the Modbus network only after receiving the controlling or inquiring message (command) from the master (response). After the master sends message, there is a period of time left for the controlled or inquired slaves to response, which ensure there is only one slave sends message to the master at a time for the avoidance of singes impact.

Generally, the user can set PC, PLC, IPC and HMI as the masters to realize central control. Setting certain device as the master is a promise other than setting by a bottom or a switch or the device has a special message format. For example, when the upper monitor is running, if the operator clicks sending command bottom, the upper monitor can send command message actively even it cannot receive the message from other devices. In this case, the upper monitor is the master. And if the designer makes the inverter send the data only after receiving the command, then the inverter is the slave.

The master can communicate with any single slave or with all slaves. For the single-visiting command, the slave should feedback a response message; for the broadcasting message from the master, the slave does not need to feedback the response message.

### 7.2 Application of the inverter

The Modbus protocol of the inverter is RTU mode and the physical layer is 2-wire RS485.

#### 7.2.1 Two-wire RS485

The interface of 2-wire RS485 works on semiduplex and its data signal applies differential transmission which is called balance transmission, too. It uses twisted pairs, one of which is defined as A (+) and the other is defined as B (-). Generally, if the positive electrical level between sending drive A and B is among +2 – +6V, it is logic“1”, if the electrical level is among -2V – -6V; it is logic“0”.

485+ on the terminal board corresponds to A and 485- to B.

Communication baud rate means the binary bit number in one second. The unit is bit/s (bps). The higher the baud rate is, the quicker the transmission speed is and the weaker the anti-interference is. If the twisted pairs of 0.56mm (24AWG) is applied as the communication cables, the max. transmission distance is as below:

| Baud rate | Max. transmission distance | Baud rate | Max. transmission distance | Baud rate | Max. transmission distance | Baud rate | Max. transmission distance |
|-----------|----------------------------|-----------|----------------------------|-----------|----------------------------|-----------|----------------------------|
| 2400 BPS  | 1800m                      | 4800 BPS  | 1200m                      | 9600 BPS  | 800m                       | 19200 BPS | 600m                       |

It is recommended to use shield cables and make the shield layer as the grounding wires during RS485 remote communication.

In the cases with less devices and shorter distance, it is recommended to use 120Ω terminal resistor as the performance will be weakened if the distance increase even though the network can perform well without load resistor.

### 7.2.1.1 Single application

Figure 1 is the site Modbus connection figure of single inverter and PC. Generally, the computer does not have RS485 interface, the RS232 or USB interface of the computer should be converted into RS485 by converter. Connect the A terminal of RS485 to the 485+ terminal of the inverter and B to the 485- terminal. It is recommended to use the shield twisted pairs. When applying RS232-RS485 converter, if the RS232 interface of the computer is connected to the RS232 interface of the converter, the wire length should be as short as possible within the length of 15m. It is recommended to connect the RS232-RS485 converter to the computer directly. If using USB-RS485 converter, the wire should be as short as possible, too.

Select a right interface to the upper monitor of the computer (select the interface of RS232-RS485 converter, such as COM1) after the wiring and set the basic parameters such as communication baud rate and digital check bit to the same as the inverter.

Figure 1 RS485 physical connection in single application

### 7.2.1.2 Multi-applications

In real multi-applications, the chrysanthemum connection and star connection are commonly used.

Chrysanthemum chain connection is required in the RS485 industrial fieldbus standards. The two ends are connected to terminal resistors of 120Ω which is shown as figure 2.

### Figure 2 Chrysanthemum connection applications

Figure 3 is the star connection. Terminal resistor should be connected to the two devices which have the longest distance. (1# and 15#device)

Figure 3 star connection

It is recommended to use shield cables in multiple connection. The basic parameter of the devices, such as baud rate and digital check bit in RS485 should be the same and there should be no repeated address.

### 7.2.2 RTU mode

#### 7.2.2.1 RTU communication frame format

If the controller is set to communicate by RTU mode in Modbus network every 8bit byte in the message includes two 4Bit hex characters. Compared with ACSII mode, this mode can send more data at the same baud rate.

### Code system

- 1 start bit
- 7 or 8 digital bit, the minimum valid bit can be sent firstly. Every 8 bit frame includes two hex characters (0...9, A...F)
- 1 even/odd check bit. If there is no checkout, the even/odd check bit is inexistent.
- 1 end bit (with checkout), 2 Bit (no checkout)

### Error detection field

- CRC

The data format is illustrated as below:

11-bit character frame (BIT1 – BIT8 are the digital bits)

|           |      |      |      |      |      |      |      |      |           |         |
|-----------|------|------|------|------|------|------|------|------|-----------|---------|
| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | BIT8 | Check bit | End bit |
|-----------|------|------|------|------|------|------|------|------|-----------|---------|

10-bit character frame (BIT1 – BIT7 are the digital bits)

|           |      |      |      |      |      |      |      |           |         |
|-----------|------|------|------|------|------|------|------|-----------|---------|
| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | Check bit | End bit |
|-----------|------|------|------|------|------|------|------|-----------|---------|

In one character frame, the digital bit takes effect. The start bit, check bit and end bit is used to send the digital bit right to the other device. The digital bit, even/odd checkout and end bit should be set as the same in real application.

The Modbus minimum idle time between frames should be no less than 3.5 bytes. The network device is detecting, even during the interval time, the network bus. When the first field (the address field) is received, the corresponding device decodes next transmitting character. When the interval time is at least 3.5 byte, the message ends.

The whole message frame in RTU mode is a continuous transmitting flow. If there is an interval time (more than 1.5 bytes) before the completion of the frame, the receiving device will renew the uncompleted message and suppose the next byte as the address field of the new message. As such, if the new message follows the previous one within the interval time of 3.5 bytes, the receiving device will deal with it as the same with the previous message. If these two phenomena all happen during the transmission, the CRC will generate a fault message to respond to the sending devices.

The standard structure of RTU frame:

|                               |                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| START                         | T1-T2-T3-T4 (transmission time of 3.5 bytes)                                                           |
| ADDR                          | Communication address: 0 – 247 (decimal system) (0 is the broadcast address)                           |
| CMD                           | 03H: read slave parameters<br>06H: write slave parameters                                              |
| DATA (N-1)<br>...<br>DATA (0) | The data of 2*N bytes are the main content of the communication as well as the core of data exchanging |

|                  |                                              |
|------------------|----------------------------------------------|
| CRC CHK low bit  | Detection value: CRC (16BIT)                 |
| CRC CHK high bit |                                              |
| END              | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

### 7.2.2.2 RTU communication frame error checkout

Various factors (such as electromagnetic interference) may cause error in the data transmission. For example, if the sending message is a logic "1", A-B potential difference on RS485 should be 6V, but in reality, it may be -6V because of electromagnetic interference, and then the other devices take the sent message as logic "0". If there is no error checkout, the receiving devices will not find the message is wrong and they may give incorrect response which cause serious result. So the checkout is essential to the message.

The theme of checkout is that: the sender calculate the sending data according to a fixed formula, and then send the result with the message. When the receiver gets this message, they will calculate another result according to the same method and compare it with the sending one. If two results are the same, the message is correct. If not, the message is incorrect.

The error checkout of the frame can be divided into two parts: the bit checkout of the byte and the whole data checkout of the frame (CRC check).

#### Bit checkout of the byte

The user can select different bit checkouts or non-checkout, which impacts the check bit setting of each byte.

The definition of even checkout: add an even check bit before the data transmission to illustrate the number of "1" in the data transmission is odd number or even number. When it is even, the check byte is "0"; otherwise, the check byte is "1". This method is used to stabilize the parity of the data.

The definition of odd checkout: add an odd check bit before the data transmission to illustrate the number of "1" in the data transmission is odd number or even number. When it is odd, the check byte is "0"; otherwise, the check byte is "1". This method is used to stabilize the parity of the data.

For example, when transmitting "11001110", there are five "1" in the data. If the even checkout is applied, the even check bit is "1"; if the odd checkout is applied; the odd check bit is "0". The even and odd check bit is calculated on the check bit position of the frame. And the receiving devices also carry out even and odd checkout. If the parity of the receiving data is different from the setting value, there is an error in the communication.

#### CRC check

The checkout uses RTU frame format. The frame includes the frame error detection field which is based on the CRC calculation method. The CRC field is two bytes, including 16 figure binary values. It is added into the frame after calculated by transmitting device. The receiving device recalculates the CRC of the received frame and compares them with the value in the

received CRC field. If the two CRC values are different, there is an error in the communication.

During CRC, 0xFFFF will be stored. And then, deal with the continuous 6-above bytes in the frame and the value in the register. Only the 8Bit data in every character is effective to CRC, while the start bit, the end and the odd and even check bit is ineffective.

The calculation of CRC applies the international standard CRC checkout principles. When the user is editing CRC calculation, he can refer to the relative standard CRC calculation to write the required CRC calculation program.

Here provided a simple function of CRC calculation for the reference (programmed with C language):

```
unsigned int crc_cal_value(unsigned char *data_value,unsigned char data_length)
{
    int i;
    unsigned int crc_value=0xffff;
    while(data_length--)
    {
        crc_value^=*data_value++;
        for(i=0;i<8;i++)
        {
            if(crc_value&0x0001)crc_value=(crc_value>>1)^0xa001;
            else crc_value=crc_value>>1;
        }
    }
    return(crc_value);
}
```

In ladder logic, CKSM calculated the CRC value according to the frame with the table inquiry. The method is advanced with easy program and quick calculation speed. But the ROM space the program occupied is huge. So use it with caution according to the program required space.

### 7.2.3 ASCII mode

| Name          | Definition                                                                                                                                                                                          |      |      |      |      |      |      |      |      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------|------|------|------|------|------|
| Coding system | Communication protocol belongs to hexadecimal system. The meaning of message character in ASCII: "0"... "9", "A"... "F", each hex is represented by the ASCII message corresponds to the character. |      |      |      |      |      |      |      |      |
|               | Character                                                                                                                                                                                           | '0'  | '1'  | '2'  | '3'  | '4'  | '5'  | '6'  | '7'  |
|               | ASCII CODE                                                                                                                                                                                          | 0x30 | 0x31 | 0x32 | 0x33 | 0x34 | 0x35 | 0x36 | 0x37 |
|               | Character                                                                                                                                                                                           | '8'  | '9'  | 'A'  | 'B'  | 'C'  | 'D'  | 'E'  | 'F'  |
|               | ASCII CODE                                                                                                                                                                                          | 0x38 | 0x39 | 0x41 | 0x42 | 0x43 | 0x44 | 0x45 | 0x46 |

|             |                                                                                           |      |      |      |      |      |      |      |           |           |
|-------------|-------------------------------------------------------------------------------------------|------|------|------|------|------|------|------|-----------|-----------|
| Data format | Starting bit, 7/8 data bit, check bit and stop bit. The data formats are listed as below: |      |      |      |      |      |      |      |           |           |
|             | 11-bit character frame:                                                                   |      |      |      |      |      |      |      |           |           |
|             | Starting bit                                                                              | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | BIT8      | Check bit |
|             | Starting bit                                                                              | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | Check bit | Stop bit  |

In ASCII mode, the frame header is “.” (“0\*3A”), frame end is “CRLF” (“0\*0D” “0\*0A”) by default. In ASCII mode, all the data bytes, except for the frame header and frame end, are transmitted in ASCII code mode, in which four high bit groups will be sent out first and then, four low bit groups will be sent out. In ASCII mode, the data length is 8 bit. As for ‘A’ – ‘F’, its capital letters is adopted for ASCII code. The data now adopts LRC checkout which covers slave address to data information. The checksum equals to the complement of the character sum of all the participated checkout data.

Standard structure of ASCII frame:

|                               |                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------|
| START                         | ‘.’ (0x3A)                                                                                 |
| Address Hi                    | Communication address:<br>8-bit address is formed by the combination of two ASCII codes    |
| Address Lo                    |                                                                                            |
| Function Hi                   | Function code:<br>8-bit address is formed by the combination of two ASCII codes            |
| Function Lo                   |                                                                                            |
| DATA (N-1)<br>...<br>DATA (0) | Data content:<br>nx8-bit data content is formed by combination of 2n (n≤16)<br>ASCII codes |
| LRC CHK Hi                    |                                                                                            |
| LRC CHK Lo                    | LRC check code:<br>8-bit check code is formed by the combination of two ASCII codes.       |
| END Hi                        |                                                                                            |
| END Lo                        | End character:<br>END Hi=CR (0x0D), END Lo=LF (0x0A)                                       |

### 7.2.3.1 ASCII mode check (LRC Check)

Check code (LRC Check) is the value combined of address and data content result. For instance, the check code of above 2.2.2 communication message is: 0x02+0x06+0x00+0x08+0x13+0x88=0xAB, then take the compliment of 2=0x55. Below is a simple LRC calculation function for user reference (programed with C language):

```
Static unsigned char
```

```
LRC(auchMsg,usDataLen)
```

```

unsigned char *auchMsg;
unsigned short usDataLen;
{
    unsigned char uchLRC=0;
    while(usDataLen--)
        uchLRC+=*auchMsg++;
    return((unsigned char)( - ((char)uchLRC)));
}

```

## 7.3 Command code and communication data illustration

### 7.3.1 RTU mode

#### 7.3.1.1 Command code: 03H

#### 03H (correspond to binary 0000 0011) ,read N words (Word) ( $N \leq 16$ )

Command code 03H means that if the master read data from the inverter, the data number depends on the "data number" in the command code. The max. number is 16 and the parameter address to be read must be continuous. The length of every data is 2 bytes (one word). The following command format is illustrated in hex (a number with "H" means hex) and one hex number occupies one byte.

This command code is used to read the working state of the inverter.

For example, read continuous 2 data content from 0004H from the inverter with the address of 01H (read the content of data address of 0004H and 0005H), the frame structure is as below:

RTU master command message (from the master to the inverter)

|                               |             |
|-------------------------------|-------------|
| START                         | T1-T2-T3-T4 |
| ADDR                          | 01H         |
| CMD                           | 03H         |
| High bit of the start address | 00H         |
| Low bit of the start address  | 04H         |
| High bit of data number       | 00H         |
| Low bit of data number        | 02H         |
| CRC low bit                   | 85H         |
| CRC high bit                  | CAH         |
| END                           | T1-T2-T3-T4 |

T1-T2-T3-T4 between START and END is to provide at least the time of 3.5 bytes as the leisure time and distinguish two messages for the avoidance of taking two messages as one message.

**ADDR** = 01H means the command message is sent to the inverter with the address of 01H and ADDR occupies one byte

**CMD**=03H means the command message is sent to read data from the inverter and CMD

occupies one byte

“**Start address**” means reading data from the address and it occupies 2 bytes with the fact that the high bit is in the front and the low bit is in the behind.

“**Data number**” means the reading data number with the unit of word. If the “start address” is 0004H and the “data number” is 0002H, the data of 0004H and 0005H will be read.

**CRC** occupies 2 bytes with the fact that the high bit is in the front and the low bit is in the behind.

**RTU** slave response message (from the inverter to the master)

|                                   |             |
|-----------------------------------|-------------|
| START                             | T1-T2-T3-T4 |
| ADDR                              | 01H         |
| CMD                               | 03H         |
| Byte number                       | 04H         |
| Data high bit of address<br>0004H | 13H         |
| Data low bit of address 0004H     | 88H         |
| Data high bit of address<br>0005H | 00H         |
| Data low bit of address 0005H     | 00H         |
| CRC CHK low bit                   | 7EH         |
| CRC CHK high bit                  | 9DH         |
| END                               | T1-T2-T3-T4 |

The meaning of the response is that:

**ADDR** = 01H means the command message is sent to the inverter with the address of 01H and ADDR occupies one byte

**CMD**=03H means the message is received from the inverter to the master for the response of reading command and CMD occupies one byte

“**Byte number**” means all byte number from the byte (excluding the byte) to CRC byte (excluding the byte). 04 means there are 4 byte of data from the “byte number” to “CRC CHK low bit”, which are “digital address 0004H high bit”, “digital address 0004H low bit”, “digital address 0005H high bit” and “digital address 0005H low bit”.

There are 2 bytes stored in one data with the fact that the high bit is in the front and the low bit is in the behind of the message, the data of data address 0004H is 1388H, and the data of data address 0005H is 0000H.

CRC occupies 2 bytes with the fact that the high bit is in the front and the low bit is in the behind.

### 7.3.1.2 Command code: 06H

06H (correspond to binary 0000 0110), write one word (Word)

This command means the master writes data to the inverter and one command can write one data only. It is used to change the parameter and working mode of the inverter.

For example, write 5000 (1388H) to 0004H from the inverter with the address of 02H, the frame structure is as below:

RTU master command message (from the master to the inverter)

|                                  |             |
|----------------------------------|-------------|
| START                            | T1-T2-T3-T4 |
| ADDR                             | 02H         |
| CMD                              | 06H         |
| High bit of writing data address | 00H         |
| Low bit of writing data address  | 04H         |
| High bit of data content         | 13H         |
| Low bit of data content          | 88H         |
| CRC CHK low bit                  | C5H         |
| CRC CHK high bit                 | 6EH         |
| END                              | T1-T2-T3-T4 |

RTU slave response message (from the inverter to the master)

|                                  |             |
|----------------------------------|-------------|
| START                            | T1-T2-T3-T4 |
| ADDR                             | 02H         |
| CMD                              | 06H         |
| High bit of writing data address | 00H         |
| Low bit of writing data address  | 04H         |
| High bit of data content         | 13H         |
| Low bit of data content          | 88H         |
| CRC CHK low bit                  | C5H         |
| CRC CHK high bit                 | 6EH         |
| END                              | T1-T2-T3-T4 |

**Note:** section 10.2 and 10.3 mainly describe the command format, and the detailed application will be mentioned in 10.8 with examples.

### 7.3.1.3 Command code 08H for diagnosis

Meaning of sub-function codes

| Sub-function Code | Description                        |
|-------------------|------------------------------------|
| 0000              | Return to inquire information data |

For example: The inquiry information string is same as the response information string when the loop detection to address 01H of driver is carried out.

The RTU request command is:

|       |             |
|-------|-------------|
| START | T1-T2-T3-T4 |
| ADDR  | 01H         |
| CMD   | 08H         |

|                               |             |
|-------------------------------|-------------|
| High bit of sub-function code | 00H         |
| Low bit of sub-function code  | 00H         |
| High bit of data content      | 12H         |
| Low bit of data content       | ABH         |
| CRC CHK low bit               | ADH         |
| CRC CHK high bit              | 14H         |
| END                           | T1-T2-T3-T4 |

The RTU response command is:

|                               |             |
|-------------------------------|-------------|
| START                         | T1-T2-T3-T4 |
| ADDR                          | 01H         |
| CMD                           | 08H         |
| High bit of sub-function code | 00H         |
| Low bit of sub-function code  | 00H         |
| High bit of data content      | 12H         |
| Low bit of data content       | ABH         |
| CRC CHK low bit               | ADH         |
| CRC CHK high bit              | 14H         |
| END                           | T1-T2-T3-T4 |

#### 7.3.1.4 Command code: 10H, continuous writing

Command code 10H means that if the master writes data to the inverter, the data number depends on the “data number” in the command code. The max. continuous reading number is 16.

For example, write 5000 (1388H) to 0004H of the inverter whose slave address is 02H and 50 (0032H) to 0005H, the frame structure is as below:

The RTU request command is:

|                         |                                              |
|-------------------------|----------------------------------------------|
| START                   | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| ADDR                    | 02H                                          |
| CMD                     | 10H                                          |
| High bit of write data  | 00H                                          |
| Low bit of write data   | 04H                                          |
| High bit of data number | 00H                                          |
| Low bit of data number  | 02H                                          |
| Byte number             | 04H                                          |
| High bit of data 0004H  | 13H                                          |
| Low bit of data 0004H   | 88H                                          |
| High bit of data 0005H  | 00H                                          |
| Low bit of data 0005H   | 32H                                          |
| Low bit of CRC          | C5H                                          |

|                 |                                              |
|-----------------|----------------------------------------------|
| High bit of CRC | 6EH                                          |
| END             | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

The RTU response command is:

|                         |                                              |
|-------------------------|----------------------------------------------|
| START                   | T1-T2-T3-T4 (transmission time of 3.5 bytes) |
| ADDR                    | 02H                                          |
| CMD                     | 10H                                          |
| High bit of write data  | 00H                                          |
| Low bit of write data   | 04H                                          |
| High bit of data number | 00H                                          |
| Low bit of data number  | 02H                                          |
| Low bit of CRC          | C5H                                          |
| High bit of CRC         | 6EH                                          |
| END                     | T1-T2-T3-T4 (transmission time of 3.5 bytes) |

### 7.3.2 ASCII mode

#### 7.3.2.1 Command code: 03H (0000 0011), read N words (Word) (N ≤ 16)

For instance: As for the inverter whose slave address is 01H, the starting address of internal storage is 0004, read two words continuously, the structure of this frame is listed as below:

| ASCII master command message (the command sent from the master to the inverter) |     | ASCII slave response message (the message sent from the inverter to the master) |     |
|---------------------------------------------------------------------------------|-----|---------------------------------------------------------------------------------|-----|
| START                                                                           | ':' | START                                                                           | ':' |
| ADDR                                                                            | '0' | ADDR                                                                            | '0' |
|                                                                                 | '1' |                                                                                 | '1' |
| CMD                                                                             | '0' | CMD                                                                             | '0' |
|                                                                                 | '3' |                                                                                 | '3' |
| High bit of starting address                                                    | '0' | Byte number                                                                     | '0' |
|                                                                                 | '0' |                                                                                 | '4' |
| Low bit of starting address                                                     | '0' | High bit of data address 0004H                                                  | '1' |
|                                                                                 | '4' | Low bit of data address 0004H                                                   | '3' |
| High bit of data number                                                         | '0' | High bit of data address 0005H                                                  | '8' |
|                                                                                 | '0' | Low bit of data address 0005H                                                   | '8' |
| Low bit of data number                                                          | '0' | Low bit of data address 0005H                                                   | '0' |
|                                                                                 | '2' |                                                                                 | '0' |
| LRC CHK Hi                                                                      | 'F' | LRC CHK Hi                                                                      | '0' |
| LRC CHK Lo                                                                      | '6' |                                                                                 | '0' |
| END Hi                                                                          | CR  | LRC CHK Lo                                                                      | '5' |
| END Lo                                                                          | LF  | LRC CHK Lo                                                                      | 'D' |
|                                                                                 |     | END Hi                                                                          | CR  |
|                                                                                 |     | END Lo                                                                          | LF  |

### 7.3.2.2 Command code: 06H (0000 0110), write one word (Word)

For instance: Write 5000 (1388H) to the 0004H address of the inverter whose slave address is 02H, then the structure of this frame is listed as below:

| ASCII master command message (the command sent by the master to inverter) |     | ASCII slave response message (the message sent by the inverter to master) |     |
|---------------------------------------------------------------------------|-----|---------------------------------------------------------------------------|-----|

### 7.3.2.3 Command code: 08H (0000 1000), diagnose function

Meaning of sub function code:

| Sub function code | Instruction                 |
|-------------------|-----------------------------|
| 0000              | Return inquiry message data |

For instance: carry out circuit detection on drive address 01H, the content of inquiry message word string is the same with response message word string, its format is listed as below:

| ASCII master command message (the command sent by the master to inverter) |     | ASCII slave response message (the message sent by the inverter to master) |     |
|---------------------------------------------------------------------------|-----|---------------------------------------------------------------------------|-----|
| START                                                                     | ‘.’ | START                                                                     | ‘.’ |
| ADDR                                                                      | ‘0’ | ADDR                                                                      | ‘0’ |
|                                                                           | ‘1’ |                                                                           | ‘1’ |
| CMD                                                                       | ‘0’ | CMD                                                                       | ‘0’ |
|                                                                           | ‘8’ |                                                                           | ‘8’ |
| High bit of write data address                                            | ‘0’ | High bit of write data address                                            | ‘0’ |
|                                                                           | ‘0’ |                                                                           | ‘0’ |

| ASCII master command message (the command sent by the master to inverter) |     | ASCII slave response message (the message sent by the inverter to master) |     |
|---------------------------------------------------------------------------|-----|---------------------------------------------------------------------------|-----|
| Low bit of write data address                                             | '0' | Low bit of write data address                                             | '0' |
|                                                                           | '0' |                                                                           | '0' |

### 7.3.2.4 Command code: 10H, continuous writing function

Command code 10H means the master write data to the inverter, the number of data being written is determined by the command “data number”, the max. number of continuous writing is 16 words.

For instance: Write 5000 (1388H) to 0004H of the inverter whose slave address is 02H, write 50 (0032H) to 0005H of the inverter whose slave address is 02H, then the structure of this frame is listed as below:

| ASCII master command message (the command sent by the master to inverter) |     | ASCII slave response message (the message sent by the inverter to master) |     |
|---------------------------------------------------------------------------|-----|---------------------------------------------------------------------------|-----|
| START                                                                     | ‘.’ | START                                                                     | ‘.’ |
| ADDR                                                                      | '0' | ADDR                                                                      | '0' |
|                                                                           | '2' |                                                                           | '2' |
| CMD                                                                       | '1' | CMD                                                                       | '1' |
|                                                                           | '0' |                                                                           | '0' |
| High bit of starting address                                              | '0' | High bit of starting address                                              | '0' |

## 7.4 The definition of data address

The address definition of the communication data in this part is to control the running of the inverter and get the state information and relative function parameters of the inverter.

### 7.4.1 The rules of parameter address of the function codes

The parameter address occupies 2 bytes with the most significant byte (MSB) in the front and the least significant byte (LSB) in the behind. The ranges of the MSB and LSB are: MSB—00 – ffH; LSB—00 – ffH. The MSB is the group number before the radix point of the function code and the LSB is the number after the radix point, but both the MSB and the LSB should be converted into hex. For example P05.05, the group number before the radix point of the function code is 05, then the MSB of the parameter is 05, the number after the radix point 05, then the LSB the parameter is 05, then the function code address is 0505H and the parameter address of P10.01 is 0A01H.

|                                                                                        |                             |                                                                                                            |   |   |
|----------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------|---|---|
| P10.00                                                                                 | Simple PLC means            | 0: Stop after running once.<br>1: Run at the final value after running once.<br>2: Cycle running.          | 0 | ○ |
| <span style="border: 1px solid black; border-radius: 50%; padding: 2px;">P10.01</span> | Simple PLC memory selection | 0: Power loss without memory<br>1: Power loss: PLC record the running stage and frequency when power loss. | 0 | ○ |

**Note:** P29 group is the factory parameter which cannot be read or changed. Some parameters cannot be changed when the inverter is in the running state and some parameters cannot be changed in any state. The setting range, unit and relative instructions should be paid attention to when modifying the function code parameters.

Besides, EEPROM is stocked frequently, which may shorten the usage time of EEPROM. For users, some functions are not necessary to be stocked on the communication mode. The needs can be met on by changing the value in RAM. Changing the high bit of the function code from 0 to 1 can also realize the function. For example, the function code

P00.07 is not stocked into EEPROM. Only by changing the value in RAM can set the address to 8007H. This address can only be used in writing RAM other than reading. If it is used to read, it is an invalid address.

#### 7.4.2 The address instruction of other function in Modbus

The master can operate on the parameters of the inverter as well as control the inverter, such as running or stopping and monitoring the working state of the inverter.

Below is the parameter list of other functions

| Function instruction                         | Address definition | Data meaning instruction                                                                                                    | R/W attribute |
|----------------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|
| Communication control command                | 2000H              | 0001H: forward running                                                                                                      | W/R           |
|                                              |                    | 0002H: reverse running                                                                                                      |               |
|                                              |                    | 0003H: forward jogging                                                                                                      |               |
|                                              |                    | 0004H: reverse jogging                                                                                                      |               |

R/W characteristics means the function is with read and write characteristics. For example,

“communication control command” is writing characteristics and control the inverter with writing command (06H). R characteristic can only read other than write and W characteristic can only write other than read.

**Note:** when operating on the inverter with the table above, it is necessary to enable some parameters. For example, the operation of running and stopping, it is necessary to set P00.01 to communication running command channel and set P00.02 to MODBUS communication channel. And when operate on “PID given”, it is necessary to set P09.00 to “MODBUS communication setting”.

The encoding rules for device codes (corresponds to identifying code 2103H of the inverter)

| Code high 8bit | Meaning  | Code low 8 position | Meaning                    |
|----------------|----------|---------------------|----------------------------|
| 01             | Goodrive | 06                  | Goodrive20 Vector Inverter |

**Note:** the code is consisted of 16 bit which is high 8 bits and low 8 bits. High 8 bits mean the motor type series and low 8 bits mean the derived motor types of the series. For example, 0110H means Goodrive20 vector inverters.

### 7.4.3 Fieldbus ratio values

The communication data is expressed by hex in actual application and there is no radix point in hex. For example, 50.12Hz cannot be expressed by hex so 50.12 can be magnified by 100 times into 5012, so hex 1394H can be used to express 50.12.

A non-integer can be timed by a multiple to get an integer and the integer can be called fieldbus ratio values.

The fieldbus ratio values are referred to the radix point of the setting range or default value in the function parameter list. If there are figures behind the radix point ( $n=1$ ), then the fieldbus ratio value  $m$  is  $10^n$ . Take the table as the example:

| Function code | Name                          | Details                              | Setting range | Default value | Modify                |
|---------------|-------------------------------|--------------------------------------|---------------|---------------|-----------------------|
| P01.20        | Wake-up from sleep delay time | 0.0~3600.0s<br>(valid when P01.19=2) | 0.0~3600.0    | 0.0s          | <input type="radio"/> |
| P01.21        | Restart after power off       | 0: Disable<br>1: Enable              | 0~1           | 0             | <input type="radio"/> |

If there is one figure behind the radix point in the setting range or the default value, then the fieldbus ratio value is 10. if the data received by the upper monitor is 50, then the “hibernation restore delay time” is 5.0 ( $5.0=50\div10$ ).

If Modbus communication is used to control the hibernation restore delay time as 5.0s. Firstly, 5.0 can be magnified by 10 times to integer 50 (32H) and then this data can be sent.

|                     |                  |                       |              |              |
|---------------------|------------------|-----------------------|--------------|--------------|
| <u>01</u>           | <u>06</u>        | <u>01 14</u>          | <u>00 32</u> | <u>49 E7</u> |
| Inverter<br>address | Write<br>command | Parameters<br>address | Data number  | CRC check    |

After the inverter receives the command, it will change 50 into 5 according to the fieldbus ratio value and then set the hibernation restore delay time as 5s.

Another example, after the upper monitor sends the command of reading the parameter of hibernation restore delay time, if the response message of the inverter is as following:

|                     |                 |                |                    |              |
|---------------------|-----------------|----------------|--------------------|--------------|
| <u>01</u>           | <u>03</u>       | <u>02</u>      | <u>00 32</u>       | <u>39 91</u> |
| Inverter<br>address | Read<br>command | 2-byte<br>data | Parameters<br>data | CRC check    |

Because the parameter data is 0032H (50) and 50 divided by 10 is 5, then the hibernation restore delay time is 5s.

#### 7.4.4 Fault message response

There may be fault in the communication control. For example, some parameter can only be read. If a writing message is sent, the inverter will return a fault response message.

The fault message is from the inverter to the master, its code and meaning is as below:

| Code | Name                  | Meaning                                                                                                                                                                                                              |
|------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01H  | Illegal command       | The command from master cannot be executed. The reason maybe:<br>1. This command is only for new version and this version cannot realize.<br>2. Slave is in fault state and cannot execute it.                       |
| 02H  | Illegal data address. | Some of the operation addresses are invalid or not allowed to access. Especially the combination of the register and the transmitting bytes are invalid.                                                             |
| 03H  | Illegal value         | When there are invalid data in the message framed received by slave.<br><b>Note:</b> This error code does not indicate the data value to write exceed the range, but indicate the message frame is an illegal frame. |
| 04H  | Operation failed      | The parameter setting in parameter writing is invalid. For example, the function input terminal cannot be set repeatedly.                                                                                            |
| 05H  | Password error        | The password written to the password check address is not same as the password set by P7.00.                                                                                                                         |
| 06H  | Data frame error      | In the frame message sent by the upper monitor, the length of the digital frame is incorrect or the counting of CRC check bit in RTU is different from the lower monitor.                                            |
| 07H  | Written not allowed.  | It only happen in write command, the reason maybe:                                                                                                                                                                   |

| Code | Name                                            | Meaning                                                                                                                                         |
|------|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
|      |                                                 | 1. The written data exceeds the parameter range.<br>2. The parameter should not be modified now.<br>3. The terminal has already been used.      |
| 08H  | The parameter cannot be modified during running | The modified parameter in the writing of the upper monitor cannot be modified during running.                                                   |
| 09H  | Password protection                             | When the upper monitor is writing or reading and the user password is set without password unlocking, it will report that the system is locked. |

The slave uses functional code fields and fault addresses to indicate it is a normal response or some error occurs (named as objection response). For normal responses, the slave shows corresponding function codes, digital address or sub-function codes as the response. For objection responses, the slave returns a code which equals the normal code, but the first byte is logic 1.

For example: when the master sends a message to the slave, requiring it to read a group of address data of the inverter function codes, there will be following function codes:

0 0 0 0 0 1 1 (Hex 03H)

For normal responses, the slave responds the same codes, while for objection responses, it will return:

1 0 0 0 0 1 1 (Hex 83H)

Besides the function codes modification for the objection fault, the slave will respond a byte of abnormal code which defines the error reason.

When the master receives the response for the objection, in a typical processing, it will send the message again or modify the corresponding order.

For example, set the “running command channel” of the inverter (P00.01, parameter address is 0001H) with the address of 01H to 03, the command is as following:

|                     |                  |                       |                     |                     |
|---------------------|------------------|-----------------------|---------------------|---------------------|
| <u><b>01</b></u>    | <u><b>06</b></u> | <u><b>00 01</b></u>   | <u><b>00 03</b></u> | <u><b>98 0B</b></u> |
| Inverter<br>address | Read<br>command  | Parameters<br>address | Parameters<br>data  | CRC check           |

But the setting range of “running command channel” is 0 – 2, if it is set to 3, because the number is beyond the range, the inverter will return fault response message as below:

|                     |                           |                  |                     |
|---------------------|---------------------------|------------------|---------------------|
| <u><b>01</b></u>    | <u><b>86</b></u>          | <u><b>04</b></u> | <u><b>43 A3</b></u> |
| Inverter<br>address | Abnormal<br>response code | Fault code       | CRC check           |

Abnormal response code 86H means the abnormal response to writing command 06H; the fault code is 04H. In the table above, its name is operation failed and its meaning is that the parameter setting in parameter writing is invalid. For example, the function input terminal

cannot be set repeatedly.

## 7.5 Example of writing and reading

Refer to section 7.3 for the command format.

### 7.5.1 Example of reading command 03H

Example 1: read the state word 1 of the inverter with the address of 01H (refer to table 1). From the table 1, the parameter address of the state word 1 of the inverter is 2100H.

#### RTU mode:

The command sent to the inverter:

|                     |                 |                       |              |              |
|---------------------|-----------------|-----------------------|--------------|--------------|
| <u>01</u>           | <u>03</u>       | <u>21 00</u>          | <u>00 01</u> | <u>8E 36</u> |
| Inverter<br>address | Read<br>command | Parameters<br>address | Data number  | CRC check    |

If the response message is as below:

|                     |                 |                 |              |              |
|---------------------|-----------------|-----------------|--------------|--------------|
| <u>01</u>           | <u>03</u>       | <u>02</u>       | <u>00 03</u> | <u>F8 45</u> |
| Inverter<br>address | Read<br>command | Data<br>address | Data content | CRC check    |

#### ASCII mode:

The command sent to the inverter:

|       |                     |                 |                       |                |              |              |
|-------|---------------------|-----------------|-----------------------|----------------|--------------|--------------|
| :     | <u>01</u>           | <u>03</u>       | <u>21 00</u>          | <u>00 01</u>   | <u>DA</u>    | <u>CR LF</u> |
| START | Inverter<br>address | Read<br>command | Parameters<br>address | Data<br>number | LRC<br>check | END          |

If the response message is as below:

|       |                     |                 |                |                 |              |              |
|-------|---------------------|-----------------|----------------|-----------------|--------------|--------------|
| :     | <u>01</u>           | <u>03</u>       | <u>02</u>      | <u>00 03</u>    | <u>F7</u>    | <u>CR LF</u> |
| START | Inverter<br>address | Read<br>command | Byte<br>number | Data<br>content | LRC<br>check | END          |

The data content is 0003H. From the table 1, the inverter stops.

### 7.5.2 Example of writing command 06H

Example 1: make the inverter with the address of 03H to run forward. See table 1, the address of "communication control command" is 2000H and forward running is 0001. See the table below.

| Function instruction          | Address definition | Data meaning instruction | R/W characteristics |
|-------------------------------|--------------------|--------------------------|---------------------|
| Communication control command | 2000H              | 0001H: forward running   | W/R                 |
|                               |                    | 0002H: reverse running   |                     |
|                               |                    | 0003H: forward jogging   |                     |
|                               |                    | 0004H: reverse jogging   |                     |
|                               |                    | 0005H: stop              |                     |
|                               |                    | 0006H: coast to stop     |                     |

| Function instruction | Address definition | Data meaning instruction | R/W characteristics |
|----------------------|--------------------|--------------------------|---------------------|
|                      |                    | (emergency stop)         |                     |
|                      |                    | 0007H: fault reset       |                     |
|                      |                    | 0008H: jogging stop      |                     |

**RTU mode:**

The command sent by the master:

|                  |               |                    |                 |              |
|------------------|---------------|--------------------|-----------------|--------------|
| <u>03</u>        | <u>06</u>     | <u>20 00</u>       | <u>00 01</u>    | <u>42 28</u> |
| Inverter address | Write command | Parameters address | Forward running | CRC check    |

If the operation is successful, the response may be as below (the same with the command sent by the master):

|                  |               |                    |                 |              |
|------------------|---------------|--------------------|-----------------|--------------|
| <u>03</u>        | <u>06</u>     | <u>20 00</u>       | <u>00 01</u>    | <u>42 28</u> |
| Inverter address | Write command | Parameters address | Forward running | CRC check    |

**ASCII mode:**

The command sent to the inverter:

|       |                  |               |                    |              |           |              |
|-------|------------------|---------------|--------------------|--------------|-----------|--------------|
| :     | <u>01</u>        | <u>06</u>     | <u>20 00</u>       | <u>00 01</u> | <u>D6</u> | <u>CR LF</u> |
| START | Inverter address | Write command | Parameters address | Data number  | LRC check | END          |

If the response message is as below:

|       |                  |               |                    |              |           |              |
|-------|------------------|---------------|--------------------|--------------|-----------|--------------|
| :     | <u>01</u>        | <u>06</u>     | <u>20 00</u>       | <u>00 01</u> | <u>D6</u> | <u>CR LF</u> |
| START | Inverter address | Write command | Parameters address | Data number  | LRC check | END          |

Example 2: set the max. output frequency of the inverter with the address of 03H as 100Hz.

| Function code | Name                  | Details                       | Setting range | Default value | Modify |
|---------------|-----------------------|-------------------------------|---------------|---------------|--------|
| P00.03        | Max. output frequency | P00.04~600.00Hz<br>(400.00Hz) | 10.00~600.00  | 50.00Hz       | ⊙      |

See the figures behind the radix point, the fieldbus ratio value of the max. output frequency (P00.03) is 100. 100Hz timed by 100 is 10000 and the corresponding hex is 2710H.

**RTU mode:**

The command sent by the master:

|                  |               |                    |                 |              |
|------------------|---------------|--------------------|-----------------|--------------|
| <u>03</u>        | <u>06</u>     | <u>00 03</u>       | <u>27 10</u>    | <u>62 14</u> |
| Inverter address | Write command | Parameters address | Forward running | CRC check    |

If the operation is successful, the response may be as below (the same with the command sent by the master):

|                     |                  |                       |                 |              |
|---------------------|------------------|-----------------------|-----------------|--------------|
| <u>03</u>           | <u>06</u>        | <u>00 03</u>          | <u>27 10</u>    | <u>62 14</u> |
| Inverter<br>address | Write<br>command | Parameters<br>address | Forward running | CRC check    |

### ASCII mode:

The command sent to the inverter:

|       |                     |                  |                       |                |              |              |
|-------|---------------------|------------------|-----------------------|----------------|--------------|--------------|
| :     | <u>03</u>           | <u>06</u>        | <u>00 03</u>          | <u>27 10</u>   | <u>BD</u>    | <u>CR LF</u> |
| START | Inverter<br>address | Write<br>command | Parameters<br>address | Data<br>number | LRC<br>check | END          |

If the response message is as below:

|       |                     |                  |                       |                |              |              |
|-------|---------------------|------------------|-----------------------|----------------|--------------|--------------|
| :     | <u>03</u>           | <u>06</u>        | <u>00 03</u>          | <u>27 10</u>   | <u>BD</u>    | <u>CR LF</u> |
| START | Inverter<br>address | Write<br>command | Parameters<br>address | Data<br>number | LRC<br>check | END          |

### 7.5.3 Example of continuous writing command 10H

Example 1: make the inverter whose address is 01H run forward at 10Hz. Refer to the instruction of 2000H and 0001. Set the address of "communication setting frequency" is 2001H and 10Hz corresponds to 03E8H. See the table below.

| Function instruction                 | Address definition | Data meaning instruction                                  | R/W attribute |
|--------------------------------------|--------------------|-----------------------------------------------------------|---------------|
| Communication control command        | 2000H              | 0001H: forward running                                    | W/R           |

|                                      |                    | 0006H: coast to stop (emergency stop)                     |               |
|                                      |                    | 0007H: fault reset                                        |               |
|                                      |                    | 0008H: jogging stop                                       |               |
| The address of communication setting | 2001H              | Communication setting frequency (0 – Fmax (unit: 0.01Hz)) | W/R           |
|                                      | 2002H              | PID given, range (0 – 1000, 1000 corresponds to 100.0% )  |               |

### RTU mode:

The command sent to the inverter:

|                     |                                  |                       |                |                |                    |              |              |
|---------------------|----------------------------------|-----------------------|----------------|----------------|--------------------|--------------|--------------|
| <u>01</u>           | <u>10</u>                        | <u>20 00</u>          | <u>00 02</u>   | <u>04</u>      | <u>00 01</u>       | <u>03 E8</u> | <u>3B 10</u> |
| Inverter<br>address | Continuous<br>writing<br>command | Parameters<br>address | Data<br>number | Byte<br>number | Forward<br>running | 10Hz         | CRC check    |

If the response message is as below:

01      10      20 00      00 02      4A 08  
 Inverter    Continuous    Parameters    Data    CRC check  
 address    writing    address    number

### ASCII mode:

The command sent to the inverter:

: 01      10      20 00 00 02 04 00 01 03 E8 BD CR LF  
 START Inverter Continuous Parameters Data Byte Forward 10Hz LRC END  
 address writing address number number running

If the response message is as below:

: 01      10      20 00      00 02      CD      CR LF  
 START Inverter Continuous Parameters Data LRC END  
 address writing address number check

Example 2: set the ACC time of 01H inverter as 10s and the DEC time as 20s

|        |            |                                     |                 |                       |
|--------|------------|-------------------------------------|-----------------|-----------------------|
| P00.11 | ACC time 1 | Setting range of P00.11 and P00.12: | Depend on model | <input type="radio"/> |
| P00.12 | DEC time 1 | 0.0 – 3600.0s                       | Depend on model | <input type="radio"/> |

The corresponding address of P00.11 is 000B, the ACC time of 10s corresponds to 0064H, and the DEC time of 20s corresponds to 00C8H.

### RTU mode:

The command sent to the inverter:

01      10      00 0B      00 02      04      00 64 00 C8      F2 55  
 Inverter Continuous Parameters Data Byte 10s 20s CRC check  
 address writing address number number

If the response message is as below:

01      10      00 0B      00 02      30 0A  
 Inverter Continuous Parameters Data CRC check  
 address writing address number

### ASCII mode:

The command sent to the inverter:

: 01      10      00 0B 00 02 04 00 64 00 C8 B2 CR LF  
 START Inverter Continuous Parameters Data 10s 20s LRC END  
 address writing address number number check

If the response message is as below:

|       |                     |                                  |                       |                |              |              |
|-------|---------------------|----------------------------------|-----------------------|----------------|--------------|--------------|
| :     | <u>01</u>           | <u>10</u>                        | <u>00 0B</u>          | <u>00 02</u>   | <u>E2</u>    | <u>CR LF</u> |
| START | Inverter<br>address | Continuous<br>writing<br>command | Parameters<br>address | Data<br>number | LRC<br>check | END          |

**Note:** the blank in the above command is for illustration. The blank cannot be added in the actual application unless the upper monitor can remove the blank by themselves.

## 7.6 Common communication fault

Common communication faults: no response to the communication or the inverter returns abnormal fault.

The possible reason for no response to the communication:

Selecting wrong serial interface, for example, if the converter is COM1, selecting COM2 during the communication

The baud rate, digital bit, end bit and check bit are not the same with the inverter + and - of RS485 are connected in reverse.

The 485 wire cap on the terminal board of the inverter is not plug in. the wire cap in behind the terminal arrangement.

## Appendix A Technical Data

### A.1 Ratings

#### A.1.1 Capacity

Inverter sizing is based on the rated motor current and power. To achieve the rated motor power given in the table, the rated current of the inverter must be higher than or equal to the rated motor current. Also the rated power of the inverter must be higher than or equal to the rated motor power. The power ratings are the same regardless of the supply voltage within one voltage range.

#### Note:

1. The maximum allowed motor shaft power is limited to  $1.5 \cdot P_N$ . If the limit is exceeded, motor torque and current are automatically restricted. The function protects the input bridge of the drive against overload.
2. The ratings apply at ambient temperature of  $40^\circ\text{C}$ .
3. It is important to check that in common DC systems the power flowing through the common DC connection does not exceed  $P_N$ .

#### A.1.2 Derating

The load capacity decreases if the installation site ambient temperature exceeds  $40^\circ\text{C}$ , the altitude exceeds 1000 meters or the switching frequency is changed from 4 kHz to 8, 12 or 15 kHz.

##### A.1.2.1 Temperature derating

In the temperature range  $+40^\circ\text{C} \dots +50^\circ\text{C}$ , the rated output current is decreased by 1% for every additional  $1^\circ\text{C}$ . Refer to the below list for the actual derating.

##### A.1.2.2 Altitude derating

The device can output rated power if the installation site below 1000m. The output power decreases if the altitude exceeds 1000 meters. Below is the detailed decreasing range of the derating:

## A.2 CE

### A.2.1 CE marking

The CE mark is attached to the drive to verify that the drive follows the provisions of the European Low Voltage (2006/95/EC) and EMC Directives (2004/108/EC).

### A.2.2 Compliance with the European EMC Directive

The EMC Directive defines the requirements for immunity and emissions of electrical equipment used within the European Union. The EMC product standard (EN 61800-3:2004) covers requirements stated for drives. See section *EMC regulations*

## A.3 EMC regulations

EMC product standard (EN 61800-3:2004) contains the EMC requirements to the inverter.

First environment: domestic environment (includes establishments connected to a low-voltage network which supplies buildings used for domestic purposes).

Second environment includes establishments connected to a network not directly supplying domestic premises.

Four categories of the inverter:

Inverter of category C1: inverter of rated voltage less than 1000 V and used in the first environment.

Inverter of category C2: inverter of rated voltage less than 1000 V other than pins, sockets and motion devices and intended to be installed and commissioned only by a professional electrician when used in the first environment.

**Note:** IEC/EN 61800-3 in EMC standard doesn't limit the power distribution of the inverter, but it defines the upstage, installation and commission. The professional electrician has necessary skills in installing and/or commissioning power drive systems, including their EMC aspects.

Inverter of category C3: inverter of rated voltage less than 1000 V and used in the second environment other than the first one

Inverter of category C4: inverter of rated voltage more than 1000 V or the nominal current is above or equal to 400A and used in the complicated system in second environment

### A.3.1 Category C2

The emission limits are complied with the following provisions:

1. The optional EMC filter is selected according to the options and installed as specified in

the EMC filter manual.

2. The motor and control cables are selected as specified in this manual.
3. The drive is installed according to the instructions given in this manual.

✧ **In a domestic environment, this product may cause radio interference, in which case supplementary mitigation measures may be required.**

### A.3.2 Category C3

The immunity performance of the drive complies with the demands of IEC/EN 61800-3, second environment.

The emission limits are complied with the following provisions:

1. The optional EMC filter is selected according to the options and installed as specified in the EMC filter manual.
2. The motor and control cables are selected as specified in this manual.
3. The drive is installed according to the instructions given in this manual.

✧ **A drive of category C3 is not intended to be used on a low-voltage public network which supplies domestic premises. Radio frequency interference is expected if the drive is used on such a network.**

## Appendix B Dimension Drawings

Dimension drawings of the Goodrive20 are shown below. The dimensions are given in millimeters and inches.

### B.1 External keypad structure

Note: The external keypad is optional for the inverters (1PH 230V/3PH 400V  $\leq 2.2\text{kW}$  and 3PH 230V  $\leq 0.75\text{kW}$ ); the standard keypad of inverters (3PH 400V  $\geq 4\text{kW}$  and 3PH 230V  $\geq 1.5\text{kW}$ ) can be used as the external keypad.

The keypad can be installed on the bracket if it is external.

## B.2 Inverter chart

Wall mounting of 0.75 – 2.2kW inverters (Dimension (unit: mm))

| Model        | W1   | W2   | H1    | H2    | D1    | D2    | Installation hole (d) |

Note: The installation bracket is optional.

## Appendix C Peripheral Options and Parts

This chapter describes how to select the options and parts of Goodrive20 series.

### C.1 Peripheral wiring

Below is the peripheral wiring of Goodrive20 series inverters.

| Pictures                                                                           | Name            | Descriptions                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | External keypad | Including the external keypads with and without the function of parameter copying.<br>When the external keypad with the function of parameter copying is valid, the local keypad is off;<br>when the external keypad without the function of parameter copying is valid, the local and external keypads are on at the same time. |
|  | Cables          | Device to transfer the electronic signals                                                                                                                                                                                                                                                                                        |

| Pictures                                                                          | Name                                         | Descriptions                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Breaker                                      | Prevent from electric shock and protect the power supply and the cables system from overcurrent when short circuits occur. (Please select the breaker with the function of reducing high order harmonic and the rated sensitive current to 1 inverter should be above 30mA). |
|   | Input reactor                                | This device is used to improve the power factor of the input side of the inverter and control the higher harmonic current.                                                                                                                                                   |
|   | Input filter                                 | Control the electromagnetic interference generated from the inverter, please install close to the input terminal side of the inverter.                                                                                                                                       |
|  | Braking resistors                            | Shorten the DEC time.<br>Only braking resistors are needed for Goodrive20 inverters.                                                                                                                                                                                         |
|   | Output filter                                | Control the interference from the output side of the inverter and please install close to the output terminals of the inverter.                                                                                                                                              |
|   | Output reactor                               | Prolong the effective transmitting distance of the inverter to control the sudden high voltage when switching on/off the IGBT of the inverter.                                                                                                                               |
|  | Membrane of heat releasing holes at the side | Apply to severe environment and improve protective effect.<br>Derate 10% of the machine.                                                                                                                                                                                     |

## C.2 Power supply

|                                                                                   |                                                                                                               |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
|  | <p>⚡ Check that the voltage degree of the inverter complies with the voltage of the supply power voltage.</p> |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|

## C.3 Cables

### C.3.1 Power cables

Dimension the input power and motor cables according to local regulations.

**Note:** A separate PE conductor is required if the conductivity of the cable shield is not sufficient for the purpose.

### C.3.2 Control cables

All analog control cables and the cable used for the frequency input must be shielded.

The relay cable needs the cable type with braided metallic screen.

**Note: Run analog and digital signals in separate cables.**

Check the insulation of the input power cable according to local regulations before connecting to the drive.

| Model        | Recommended cable size (mm <sup>2</sup> ) |     | Connecting cable size (mm <sup>2</sup> ) |          |         | Terminal screw | Tightening torque (Nm) |
|--------------|-------------------------------------------|-----|------------------------------------------|----------|---------|----------------|------------------------|
|              | RST                                       | PE  | RST                                      | P1, (+)  | PE      |                |                        |
|              | UVW                                       |     | UVW                                      |          |         |                |                        |
| GD20-0R4G-S2 | 1.5                                       | 1.5 | 1 – 4                                    | 1 – 4    | 1 – 4   | M3             | 0.8                    |

**Note:**

1. It is appropriate to use the recommended cable size under 40°C and rated current. The wiring distance should be no more than 100m.
2. Terminals P1, (+), PB and (-) connects the DC reactor options and parts.

## C.4 Breaker and electromagnetic contactor

It is necessary to add fuse for the avoidance of overload.

It is appropriate to use a breaker (MCCB) which complies with the inverter power in the 3-phase AC power and input power and terminals. The capacity of the inverter should be 1.5-2 times of the rated current.

✧ **Due to the inherent operating principle and construction of circuit breakers, independent of the manufacturer, hot ionized gases may escape from the breaker enclosure in case of a short-circuit. To ensure safe use, special attention must be paid to the installation and placement of the breakers. Follow the manufacturer's instructions.**

It is necessary to install the electromagnetic contactor in the input side to control the switching on and off safety of the main circuit. It can switch off the input power supply when system faults.

| Model        | Fuse (A) | Breaker (A) | Rated working current of the contactor (A) |

## C.5 Reactors

Transient high current in the input power circuit may cause damage to the rectifying components. It is appropriate to use AC reactor in the input side for the avoidance of high-voltage input of the power supply and improvement of the power factors.

If the distance between the inverter and the motor is longer than 50m, frequent overcurrent protection may occur to the inverter because of high leakage current caused by parasitic capacitance effects from the long cables to the ground. In order to avoid the damage of the motor insulation, it is necessary to add reactor compensation. If the distance between the inverter and motor is 50 – 100m, see the table below for model selection; if it exceeds 100m, consult with Universal Motors technical support.

| Model        | Input reactor | Output reactor |
|--------------|---------------|----------------|

### C.6.2 C3 filter

Goodrive20 series 1PH 220V/3PH 380V 2.2kW and below, 3PH 220V 0.75kW and below models can satisfy the requirements of IEC61800-3 C3 as shown in the table below; 3PH 380V 4kW and above, 3PH 220V 1.5kW and above models can be set to satisfy the requirements of IEC61800-3 C3 or not by jumper J10.

**(Note: Jumper J10 is put in the same bag with operation manual)**

**Note: Disconnect J10 when either of below situations occurs:**

1. EMC filter is suitable for the neutral-grounding grid system. If it is used in IT grid system (neutral point is not grounded), disconnect J10;
2. During configuring residual current circuit-breaker, if tripping occurred during startup, disconnect J10.

Interference filter on input side: As the inverter may interfere with peripheral devices during working, this filter can be used to reduce the interference.

Noise filter on output side: This filter can be used to reduce the radio noise caused between the inverter and motor as well as the leakage current of the lead wires.

| Model        | Input filter    |

| GD20-2R2G-4 |              |

**Note:**

1. The input EMI meet the requirement of C3 after adding input filters.
2. Above options are external, the customer should indicate when purchasing.

**C.6.3 Installation instruction for C3 filter**

The installation procedures for C3 filter are as below:

1. Connect the filter cable to the corresponding input terminal of the inverter according to the label;
2. Fix the filter onto the inverter with M3\*10 screws (as shown in above picture).

**C.6.4 C2 Filter type instruction**

**Note:**

1. The input EMI meet the requirement of C2 after adding input filters.

2. Above options are external, the customer should indicate when purchasing.

## C.7 Braking components

### C.7.1 Select the braking components

It is appropriate to use braking resistor or braking unit when the motor brakes sharply or the motor is driven by a high inertia load. The motor will become a generator if its actual rotating speed is higher than the corresponding speed of the reference frequency. As a result, the inertial energy of the motor and load return to the inverter to charge the capacitors in the main DC circuit. When the voltage increases to the limit, damage may occur to the inverter. It is necessary to apply braking unit/resistor to avoid this accident happens.

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Note:**

Select the resistor and power of the braking unit according to the data our company provided.

The braking resistor may increase the braking torque of the inverter. The resistor power in the above table is designed on 100% braking torque and 10% braking usage ratio. If the users need more braking torque, the braking resistor can decrease properly and the power needs to be magnified.

|                                                                                    |                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ⚡ <b>Never use a brake resistor with a resistance below the minimum value specified for the particular drive. The drive and the internal chopper are not able to handle the overcurrent caused by the low resistance.</b> |
|  | ⚠ <b>Increase the power of the braking resistor properly in the frequent braking situation (the frequency usage ratio is more than 10%).</b>                                                                              |

**C.7.2 Placing the brake resistor**

Use shielded cables for braking resistor cables.

Install all resistors in a place where they will cool.

✧ **The materials near the brake resistor must be non-flammable. The surface temperature of the resistor is high. Air flowing from the resistor is of hundreds of degrees Celsius. Protect the resistor against contact.**

Only external braking resistor is needed in Goodrive20.

## **Appendix D Further Information**

### **D.1 Product and service inquiry**

Address any inquiries about the product to your local Universal Motors offices, quoting the type designation and serial number of the unit in question.

### **D.2 Document library on the Internet**

You can find manuals and other product documents in PDF format on the Internet. Go to [www.universalmotors.pt](http://www.universalmotors.pt) and select Documents.
