Thanks for your confidence choosing our product.

These operating instructions present themselves as an overview of the technical data and features.

Please read the operating instructions before operating the product.

If you have any questions, please contact your nearest SSD Drives representative.

Improper application of the product in combination with dangerous voltage can lead to injuries.

In addition, damage can also occur to motors or other products.

Therefore please observe our safety precautions strictly.

Safety precautions

We assume that, as an expert, you are familiar with the relevant safety regulations, especially in accordance with VDE 0100, VDE 0113, VDE 0160, EN 50178, the accident prevention regulations of the employers liability insurance company and the DIN regulations and that you are able to use and apply them.

As well, relevant European Directives must be observed.

Depending on the kind of application, additional regulations e.g. UL, DIN are subject to be observed.

If our products are operated in connection with components from other manufacturers, their operating instructions are also subject to be observed strictly.

Attention

Digital servo drives, corresponding to EN 50178/VDE 0160, are power electronic components utilized for the regulation of the flow of energy in electrical power installations. They are exclusively designed and configured to supply SSD Drives, or SSD Drives approved, servo motors. Handling, installation, operation, and maintenance are only permitted under the conditions of and in keeping with the effective and/or legal regulations, regulation publications and this technical document.

The operator must make sure that these regulations are strictly followed.

The Concept of Galvanic Separation and Insulation:

Galvanic separation and insulation corresponding to EN 50178/VDE 0160, provides for additional insulation protection.

In addition, all digital signal inputs and outputs are provided with a galvanic separation utilizing either a relay or an optical coupler. In this way, an increased level of protection against potential interference and a limitation of potential damage due to incorrect connections are provided.

The voltage level must not exceed the designated low safety voltage of 60V DC or 25V AC, respectively, in accordance with EN 50178/VDE 0160. The operator must make sure that these regulations are strictly followed.

Danger !

High Voltage!
Danger of Electrocution!
Life Threatening Danger!

Caution !

Due to safety considerations and the product guarantee, the operator is prohibited from opening the servo drive case. Service, maintenance and repair of SSD Drives products should only be carried out by specified representatives of the company. Expert configuration and professional installation, as described by this document, are the best way to insure for the problem-free operation of the SSD Drives servo drive!

**Please
observe!**

Pay Special Attention to the Following:

Permissible Protection Class: Protective Grounding - operation is only permitted when the protective conductor is connected according to regulations.

The operation of servo drives is not allowed, under the sole use of a residual current operated protective device as protection against indirect touching. The servo drive may only be used in the rack or in its compact enclosure.

Furthermore the regulator is designed solely for control cabinet operation.

Work on or with the servo drive may only be carried out with insulated tools.

Installation work may only be done in a de-energized state. When working on the drive, one should not only block the active – input, but also separate the drive completely from the main power connection.

CAUTION - Risk of Electrical Shock:

Wait 3 minutes after switching the component off, to allow the capacitors to discharge.

Screws sealed with varnish fulfill an important protection function and may not be moved or removed.

It is prohibited to penetrate the inside of the unit with objects of any kind.

Protect the unit from falling parts, pieces of wire, metal parts, etc., during installation or other work in the control cabinet. Metal parts can lead to a short-circuit in the servo drive.

Before putting the unit into operation, remove additional covers so that the unit does not overheat. With measurements at the servo drive it is absolutely necessary to observe the potential separation

Stop !

SSD Drives GmbH is not liable for damages which may occur when the instructions and/or the applicable regulations are not explicitly observed!

1.1 System Description

The 5th generation of the digital servo drive serves to regulate the current, speed and position of **AC servo motors**, (standard: with resolver)

All control circuits and functions are realized digitally.

System variants

Explanations for the rack and power supply modules are documented in separate descriptions.

If required, the returned braking energy can be drawn off into additional external ballast resistors.

The AC-supply voltage is fed directly or via transformer to the associated power supply module.

The devices are designed to be operated on networks which are grounded at the centre point (TN networks) !

System Description

1.1.1 Digital Communication

Diagnostics / Setup

General: by 7 segment display

Comfortable: via PC with EASYRIDER® Windows – Software from version V8.xx
(serial interface RS232)

Communication

The serial-communication-protocol is open and fully documented.

(Explanation see separate documentation)

Every user has unrestricted access to all functions and parameters.

1.1.2 Operation configurations

There are opportunities ranging from simple current and speed control to programmable position control processes (PLC), supported by the 1500 BIAS command blocks.

"BIAS" User shell for intelligent drive controls

see:

- chapter 3 Operating modes
- chapter 13.2 BIAS commands
- chapter 13.3 Extended BIAS commands

System Description

1.1.3 Compatibility with 637 Servo Drives (Not required for new projects)

The 637f series servo drives are essentially pin- and functionally compatible with the servo drives 637. However, when a servo drive 637 is replaced with a 637f drive, the existing application must be checked and carefully tested to determine compliance under the corresponding safety precautions.

The following points should be checked in any case and eventually be adjusted before the function test:

1. Motor direction parameter and limit switch setting (see release note V6.12)
2. Position setpoints and comparison values have to be quadrupled, resp. sixteenfold (low encoder resolution at 637)
3. Coupling factors in synchronous applications have to be quadrupled, resp. sixteenfold (low encoder resolution at 637)
4. Execution of BIAS- and PLC programs is 2.25 times quicker than with the 637. This can cause timing problems with improper programming (e.g. wait times with NOPs)

1.1.4 Compatibility with 637+ Servo Drives (Not required for new projects)

Der Servoregler **637f** ist voll funktionskompatibel zu **637+**

Range Data

1.3.5 Single- and Three-Phase Supply

Due to the line-ripple of the DC-Bus, the rate of usable output voltage is reduced as follows. This reduction affects the maximum attainable speed of the applied motor.

Three-phase supply:

The unloaded output voltage will be reduced to approx. 90%, maximally 85 %

Single-phase supply: 50 – 60 Hz

only servo drive 637f / ..02 up to 06

see the following diagram:

Hint for parameterization:

To avoid unexpected tripping of the under voltage threshold, the parameter setting should be left on default values (EASYRIDER® Windows – Software).

Required motor-terminal-voltage for specified speed.

Approximation: (up to 3000RPM)

$$U_{kl} = 1,2 * (EMF * n / 1000) + I * (R_{ph} + R_L) [V]$$

U _{kl}	Required motor voltage [V _{RMS}]
EMF	Back-EMF of motor [V _{RMS}] / 1000 RPM
R _{ph}	Resistance of motor (between terminals) [Ω]
R _L	Line resistance of motor cable [Ω]
I	Motor-current [A _{RMS}]

Range Data

1.3.6 Output Power

In case of continuous operation in the full-load range, the limits as shown in the following diagram need to be respected.

Typical servo applications are not affected by this restriction. (S3 operation: Start/Stop).

1.4 Dimensions

1.4.1 Dimensions for Compact Device and Plug-In Module

	637f/K D6R 02...10	width	637f/K D6R 16...30	width
A	65,0 mm	14 HP	104,6 mm	20 HP
B	60,0 mm		100,0 mm	
C	30,0 mm		71,0 mm	
D	14,5 mm		14,5 mm	
a	40,2 mm	8 HP	80,4 mm	16 HP

1 HP ≈ 5,08mm

Important Note:

You will need additional space on the front side, of approx. 70 mm, for the signal mating plugs!

Dimensions

1.4.2 EMC-Clip (optional)

1.4.2.1 For 8 HP Drive

1.4.2.2 For 16 HP Drive

EMC - Clip for	
Feedback cable (e.g. Resolver)	1
Mains cable	2
Motor cable	3

Meaning:

1,2,3 = cage clamp terminals

General View of Connections for Compact Device 637f/ K D6R 02 – 10

2.1.2 637f/K D6R 16...30 Width 20 HP

2.2 Connector Pin Assignments and Contact Functions

2.2.1 Power Connections for Plug-In Module 637f/D6R

(at the rear of the rack)

(H15 multiple pin strip according to DIN 41612)

1) Faston - flat connector shoe 6,3 mm

2) parallel wires for nominal currents >15A

3) only ground when operating with isolated transformer !

Do not ground when operating with autotransformer or directly on mains!

4) resistor, provided that it is not accessed from power unit NEB.

2.3 Signal Connections

2.3.1 Control Signal Plug X10 - SUB D25 Socket

Complete Representation X10

Reference to pin 22 & pin 23: With controllers with option module SBT, kindly note the extended functions of these signals (see documentation 07-02-10-02-E-Vxxxx).

Signal Connections

Control Signal Plug X10 - SUB D25 Socket

Connection Example
(without option SBT)

drive side
control signal plug X10
model: SUB D 25

1) Security- and supervising logic, to be programmed by user !

2) **IMPORTANT:**

The power-supply for the motor-brake has to be adapted to the type of brake.
Voltage-Drops caused by long cables also may effect malfunctions of the brake.

Signal Connections

Control Signal Plug X10 - SUB D25 Socket

17	actual speed value monitor, scalable		MP1 analog output, 0...+10V	
18	nominal speed value; scalable differential referenced to X10.5		Analog input 0...+10V / Ri = 10 kOhm	
19	Setting of the current limit can be activated and scaled (0...+10V for 0.. I _{max})		analog input 0...+10V Ri = 10 kOhm	
20	configurable (chapter 3)	OPTO	Output	
21	Nominal: 24V DC		Supply for outputs	
22	H = output stage is active L = output stage inactive	OPTO	input fixed: active	
23	configurable (chapter 3)	Relay	output	
24	configurable (chapter 3)	OPTO	input	
25	configurable (chapter 3)	OPTO	input	

Data of the digital inputs and outputs **see** chapter 11 General technical data

Reference to Pin 22 & Pin 23: With controllers with option module SBT, kindly note the extended functions of these signals (see documentation 07-02-10-02-E-Vxxxx).

2.4 Feedback Sensor X30

The Feedback system generates a digital value, representing the rotor position

Derived from this value:

- commutation according to pole pair number
- actual speed value
- position value for position control

2.4.1 Function module X300

The connector X30 is directly related to the function module X300. This plug-in module (**see** chapter 1.4.3.1) determines the type of usable Feedback system.

Thus the 637f drive system gets flexibility and is adaptable to future requirements.

Types X300	Description
X300_RD2	Standard Resolver
X300_HF2	Option HIPERFACE®
X300_SC2	Option Sinus/Cosinus
Further types on request	

Plug and Play

The 637f identifies the type of the module X300.

The EASYRIDER® Windows – Software loads the correct function code.

You follow the instructions in the EASYRIDER® Windows – Software.

At function module RD2 the function code is already installed (factory default).

Note:

With application of the function module X300_HF2 (HIPERFACE®) please observe documentation 07-02-09-02-E-Vxxxx.

Feedback Sensor X30

2.4.2 Feedback Sensor Connection X30 (SUB D 09 Socket)

Pinning of Motor - Feedback - Socket X30 with:

Resolver Module X300_RD2 (Standard Module)

Module: X300_RD2	
PIN X30	Function
1	shield
2	PTC optional

2	5,5 V
3	cos +
4	sin +
5	zero pulse +
6	-
7	ref cos
8	ref sin
9	zero pulse -

2.5 Multi-function X40

Description of the X40:

Via a programmable I/O processor, the X40 connection can be configured differently.

EASYRIDER® Windows - Software

Standard functions:

- Incremental output
- Incremental input
- Stepper motor - pulse inputs
- SSI interface

The unobstructed configurability provides ideal conditions for synchronous applications.

General data	X40
plug type:	SUB D 09 male plug
maximum input or output frequency:	200 kHz
maximum cable length connected to galvanical insulated terminals (Encoder, controls)	25 m; for extended distances please contact our engineer
maximum cable length connected to ground-related terminals (other drives, controls)	2 m, take care for good common grounding !
maximum number of signal inputs to one as incremental-output configured device	8
output signals:	driver model MAX483 or compatible, RS422
differential logic level:	$L \leq 0,5V$ $H \geq 2,5V$
nominal range:	0,0 ... 5,0V
input signals:	receiver model MAX483 or compatible, RS422
differential input level:	diff min = 0,2V
nominal signal difference:	1,0V
current consumption:	1...4 mA (depending on frequency)

Notice:

Master / Slave operation

1 Master, maximum 8 Slaves

Condition: Devices directly side by side !

Multi-function X40

2.5.1 Incremental Output

EASYRIDER® Windows - Software X40 **Mode = 0**

Incremental encoder simulation for processing in positioning modules

Standard: 1024 increments

pulse duty cycle

further selectable pulse numbers: 2048, 512, 256, 128, 64, 4096

Inr. I/O X40		
PIN X40	Function	Designation
1	Channel B	B
2	Channel B inverted	/B
3	Shield connector	Shield
4	Channel A	A
5	Channel A inverted	/A
6	Reference *	GND
7	Channel Z inverted zero impulse	/Z
8	Channel Z, zero impulse	Z
9	Supply voltage output max. 150 mA	+ 5 VDC

Design Rule:

The input frequency range of the connected control must meet at least the value of pulse output frequency on X40.

n = max. speed (rpm)

x = increments e.g. 1024

f = output frequency at X40.1,2,4,5

$$\text{Formula: } f = \frac{1,2 * (n * x)}{60} = [\text{Hz}]$$

Example: n = 4000 1/min

$$f = \frac{1,2 * (4000 * 1024)}{60} = 81920 \text{ Hz}$$

2.5.2 Incremental-Input

EASYRIDER® Windows - Software X40 **Mode = 1**

Parameter range of the input signals: 10...1000000 increments

Figure:

Note:

The operation of incremental encoders via long cables may cause a voltage drop of the encoder power supply. We recommend the use of a separate voltage supply if necessary.

Multi-function X40

2.5.3 Stepper Motor Input

pulse / direction

EASYRIDER® Windows - Software X40 **Mode = 2**

Inr. I/O X40		
PIN X40	Function	Designation
1	Output: Drive active inverted	/READY
2	Output: Drive active	READY
3	Shield connector	Schild
4	Pulse inverted	/P
5	Pulse	P
6	Reference potential (generally to connect)	GND
7	Direction inverted	/R
8	Direction	R
9	Supply voltage output max. 150 mA	+5 VDC

2.5.4 Stepper Motor Input

pulse positive / negative

EASYRIDER® Windows - Software X40 **Mode = 3**

Figure: Puls / Richtung

Figure: Puls positiv / negativ

Multi-function X40

2.5.5 SSI Encoder Interface

EASYRIDER® Windows - Software X40 Mode = SSI_13 bit Singleturn

EASYRIDER® Windows - Software X40 Mode = SSI_14 bit Singleturn

EASYRIDER® Windows - Software X40 Mode = SSI_25 bit Multiturn

(13 bit Single- / 12 bit Multiturn)

EASYRIDER® Windows - Software X40 Mode = SSI_26 bit Multiturn

(14 bit Single- / 12 bit Multiturn)

Inr. I/O X40			
PIN X40	Function	Designation	
1	Serial data from SSI encoder, GRAY code up to 26 bit inverted	/DATA	
2	Serial data from SSI encoder, GRAY code up to 26 bit	DATA	
3	Shield connector	Schirm	
4	Clock output, inverted Standard frequency: 179 kHz	/TAKT	
5	Clock output Standard frequency: 179 kHz	TAKT	
6	Reference potential	GND	
7	do not connect		
8	do not connect		
9	Supply voltage output max. 150 mA If other data required: a) Use of X300 module b) External supply	+5 VDC	

TAKT and /TAKT twisted pair

DATA and /DATA twisted pair

Cable screened, screen grounded at both sides,
max. cable length: 200m

Note:

For further information about SSI (Synchronous Serial Interface), please refer to the documentations of appropriate suppliers.
(e.g.: Comp. Sick or Hengstler)

2.6 Digital Interfaces

2.6.1 Service Interface - COM1 (RS232)

Standard

Functions:

- Supporting all diagnosis and setup tasks
- Connection to your PC is made with the SSD Drives communication cable KnPC/D
- Communication is made via the SSD Drives operating program (EASYRIDER® Windows - Software)

Com 1 RS232	PIN	Function drive side	PIN	RS232 PC side
4-pin modular jack				
RXD	1	Receive serial data	3	TXD
TXD	2	Transmit serial data	2	RXD
	3	do not connect		
GND	4	GND	5	GND

Type Code	Länge	Beschreibung
Kn PC 637f / 631-03.0	3 m	PC-side, Sub D 09-plug
Kn PC 637f / 631-05.0	5 m	Drive side, 4-pin RJ 10-plug

Note:

The service interface RS232 is not galvanically isolated and should not be planned for this reason as an operating interface ("hard-wiring")!

The mains connection of the PC must be made closed to the drive, to achieve a common ground.

Digital Interfaces

2.6.2 Fieldbus Interface - COM2

Option modules SUB D09 socket

Many different functions can be implemented by optional using of the **option modules**.

Funktionen realisiert werden. Layout - see chapter 1.2.3

Overview:

module designation		interface	galvanic isolation	design	slot
RP 232		RS 232	-	A	A

2.7 Option module RP SBT

2.7.1 Safe Stop

Connector assignment X290:

PIN X290	designation	comment	status
1	Input Active	¹⁾ OPTO	Input
2	Reference point Input Active	OPTO	Input
3	Starting lockout deactivated	Relais	Input
4	Reference point Starting lockout	Relais	Input
5	Checkback contact	Free contact	Break contact
6	Checkback contact	Free contact	Break contact

Hinweis:

- ¹⁾ With employment the option module RP SBT changes the function "AKTIV" from the connecting plug X10.22 after X290.1! The input X10.22 can be used then as free programmable input (BIAS).

Use of the function Safe Stop

The option RP_SBT of the drive controller 637fx-x.S5 supports the safety function "Safe Stop", protection against unexpected starting, according to the requirements of the EN954-1 "Category 3" and EN1037.

The stop of the machine must be caused and guaranteed before by the external machine control.

This applies in particular to vertical axes without selflocking mechanics or counterweight.

If an error arises in the drive system during the active brake phase, the axis can coast down uncontrolled or even accelerate actively.

In order to use the Starting lockout function intended, it is to be looped into the net contactor circle or emergency stop circle with the obligation-led reporting contact X290.5/6. With not plausible functioning of the Starting lockout relay, related to the operating mode of the machine, a galvanic separation of the drive concerned from the net must take place. The Starting lockout and the associated mode may be used again only after error correction.

Due to a danger analysis / view of risk (to be accomplished according to machine guideline 89/392/EWG and/or EN 292; EN 954 and EN 1050) the machine manufacturer must project the safety circuit of its machine types for the **entire machine** including all integrated components (also the electric drives).

Block diagram:

Option module RP SBT

2.7.2 Brake control and PTC evaluation

Connector assignment X280

PIN X280	designation	status
1	Supply for brake output and PTC evaluation	Input
2	Reference point for supply	Input
3	Reference point for Brake control	Output
4	Brake control Active ok.	Relais output
5	PTC	Input
6	PTC	Input

Use of the Brake control

The relay output X290.3 serves for the control of holding brakes. This output is functionally identical to the output X10.23.

The output at X290.3 has the following advantages over X10.23:

The isolation relay contact → control electronics corresponds to the basis isolation. I.e. also brake installations (which correspond to the basis isolation) without interface relays, while maintaining the PELV isolation (double) of the drive controller are operated (see X10 connection example chapter 2.3.2)

The brake control possesses an active clamping of over voltages between the two brake connections.

Stronger dimensioning of the brake contact.

Use of the PTC evaluation

The PTC connection serves for the monitoring of the engine temperature. In its function mode it is identical to the port X30.2/6. The following advantage exists over X30.2/6 :

The isolation evaluation circle → control electronics corresponds to the basis isolation. I.e. also PTC thermistors (which correspond to the basis isolation) can be evaluated, without waiving the safe separation to the control electronics.

Block diagram / Connector assignment Circuit diagram

Further details see product manual **07-02-10-02-E-V..**

The preselection of the device functions are carried out by choosing the operating modes 0...5 according to the following table, **see chapter 3.1**, (EASYSRIDER® Windows - Software).

Each operating mode allows the assignment of different in- and output functions (F0..F6).

Operating mode	Reference-source	Hints for selecting the operating
0 1 2	analog (X10.5/18)	switchable the operating modes 1 and 2 by input X10.24 speed control analog torque controller analog
3	analog (X10.5/18) / digital	simple applications with requirement of switching between position and speed control position controller (input X10.24) handling like operating mode 4
4	digital or analog in acc. to parameter set	general position-controlled systems. Up to 10 positions can be stored under identifier-numbers and activated like shown.
pos. selection (Nr. 0...9) function F2 data 2 ⁰ ...2 ⁴ input start function F2 X10.2 axis move to selected position-number output position reached function F0 X10.12 t1= 2ms minimum t2= 2ms minimum		
5	digital or analog in acc. to programming or via digital communication (e.g. fieldbus)	simple to complex systems using instructions BIAS (up to 1500 command blocks) PLC - functions for further information: see chapter 13.1 and 13.2

3.1 Operating modes and pin functions

Hint: With the assembly of the option module SBT you kindly note the extended functions of the signals (see documentation 07-02-10-02-E..)

4.1 Mounting

SSD Drives digital servo drives may be installed only in a vertical position to guarantee the best air circulation for the cooling ribs of the heat sink. Vertical installation above other drive racks or above other heat producing devices can lead to overheating. In addition the drives are to be operated exclusively in SSD Drives racks or the compact enclosure respectively.

4.2 Control cabinet - mounting

Installation should be carried out only in a control cabinet in which the inside must be free from dust, corrosive fumes, gases and all liquids.

Make absolutely sure that the condensing of evaporating liquids including atmospheric moisture is avoided. Should the digital servo drive be installed in a place where condensation is likely, a suitable anticondensation heater must be installed. The heater must be SWITCHED OFF during normal operation.

Automatic switch off is recommended

SSD Drives-digital servo drives should not be installed in areas which have been classified as dangerous, if they have not been installed in an approved enclosure in accordance with regulations and checked.

Make sure, there is enough cooling and space ! (see sketch)

- only horizontal !
- on the side
no distance is required

General rule:

It is better to place heat-producing devices low in an enclosure to support internal convection and to spread the heat. If placing such devices up high is unavoidable, enlarging the upper dimensions at the expense of height or installing fans should be considered.

4.3 Cooling

The digital servo drives are protected against damages caused by overheating. There is a thermal sensor installed on the heat sink. When the temperature rises to $>95^{\circ}\text{C}$, the drive is automatically switched off. This setting cannot be changed. Make sure a cabinet of proper size is selected for adequate air circulation

If the device becomes operated in a not ventilated device, the case volume of the specified control cabinet must be calculated in accordance with the following table !

Units	Volume of cabinet
637f/0D6R02...D6R10	0,12 m ³
637f/0D6R16...D6R30	0,25 m ³

For more exact information, please, address to the control-cabinet manufacture

5.1 Safety

The voltages carried by power supply cables, motor cables, connectors, and certain parts of the drive can cause serious electric shocks and even death

5.2 The danger of electric shocks

CAUTION !

Risk of electrical shock, wait 3 minutes after switching off, for discharging the capacitors.

Disconnect SSD Drives plug-in units from mains before working on them. A period of **three** minutes **must** pass after switching off so that the internal capacitors can discharge completely. Until the discharge time is over, there can be dangerous voltages in the module !

Persons, which monitoring or carrying out electrical installation and maintenance must be adequately qualified and schooled in these activities.

5.3 Danger areas

The use of variable speed drives of all kinds can invalidate the certification for dangerous areas (apparatus group and/or temperature class) of explosion-protected motors. Inspection and certification for the complete installation of servo motors and electronic components **must** be obtained.

5.4 Grounding, safety grounding

The grounding impedance must meet the requirements of local industrial safety regulations and should be inspected and checked at appropriate and regular intervals

5.4.1 Ground connections

It is recommended to attach a ground bus of high conductivity copper as near as possible to the servo-rack or regulator modules in order to minimize the length of the cable connections.

The recommended dimensions are:

Thickness: $d = 5$ to 6 mm

Length (m)	Width (mm)	
$< 0,5$	20	
$0,5 < 1,0$	40	
$1,0 < 1,5$	50	

Ways of raised discharge currents $> DC 10mA$ resp. $> AC 3,5mA$ the PE-Bolt of the drive has to be connected to PE using copper-cable minimum $10mm^2$!

5.5 Short-circuit capability and discharge currents

Due to the working-principle of servo drives there may discharge currents to PE exceeding DC $10mA$ resp. AC $3,5mA$.

Suitable for use on a circuit capable of delivery not more than 5000 RMS symmetrical amperes 505V maximum. (Note according to UL508C)

5.6 Fuses, contactors, filters

Compact units		637f/	KD6R 02	KD6R 04	KD6R 06	KD6R 10	KD6R 16	KD6R 22	KD6R 30

filters		only for use in earth referenced supplies(TN). Current drain to PE !							
filter types		Orientation: Table of compact units. Further types: see separate manual							

- 1) recommended for UL-requirements: Bussmann Type FRS-R, 600V, use only UL-approved fuse-holders !
 2) recommended, Klöckner Moeller for instance
 3) Measurement of conducted emissions only
 4) for applications with continuous load: see notes in chapter 5.7

5.7 Correction of supply current

Attention in case of continuous load:

Due to the capacitive input impedance of DC-Bus, the input current is deformed.

This guides to RMS -values higher than the sinus-based calculated values. Fuses, contactors and line filters have to be selected in respect to this effect.

In typical servo application with Stop/Go-operation (S3-Operation), the rating to nominal data will be sufficient.

In other cases, the value has to be corrected using the following diagram.

Example:

Drive type 637f/KD6R16.S5-7 is supplied by AC 230V 3-ph.

Output-power: $P_{out} = 200V \times 16A \times 1,73 = 5,54 \text{ kW}$

This output-power must be generated by:

calculated supply-current lac sinus = $5,54kW / (230V \times 1,73) = 13,9 \text{ A}$

Correction-Factor from diagram: 1,6

RMS. Supply-Current $I_{eff} = I_{ac \text{ sinus}} \times 1,6 = 22,3 \text{ A}$

Result:

All supply-equipment has to be selected in respect to the enhanced current.

5.8 Brake resistor

5.8.1 Selection of the brake resistor

The energy of a moving system flows back to the Drive. The DC-Bus capacitors are able to take a small value. The rest has to be converted to heat by a resistor.

Switching of this brake resistor depends on the DC-Bus voltage.

The load of the resistor is simulated and supervised electronically

(EASYSRIDER® Windows - Software). Peak power (P_{max}) and continuous power (P_d) ratings have to be sufficient to meet the requirements of the application.

Calculation	
Step 1	example
Calculation of brake-power (Approximation. Capacitor-load, friction-and drive-losses neglected)	
Power of motion: $P_{kin} = 0,0055 * J * n1^2 / tb1 \text{ [W]}$	$P_{kin} = 0,0055 * 0,0005 * 3000^2 / 0,1$ $P_{kin} = 247 \text{ W}$
Motor-losses: $P_{vmot} = Ib^2 * (Ri + RL) \text{ [W]}$	$P_{vmot} = 3,2^2 * (3,6 + 0,3)$ $P_{vmot} = 40 \text{ W}$
Cont. Power: $P_d = 0,9 * (P_{kin} - P_{vmot}) * tb1 / T \text{ [W]}$	$P_d = 0,9 * (247 - 40) * 0,1 / 2$ $P_d = 9,3 \text{ W}$
Peak-Power: $P_{max} = (1,8 * P_{kin}) - P_{vmot} \text{ [W]}$	$P_{max} = (1,8 * 247) - 40$ $P_{max} = 405 \text{ W}$
used units: J total inertia [kgm ²] $n1$ speed at Brake-Start [RPM] $tb1$ braking time [Sec] T cykle time [Sec] Ib brake-current [A] R_{ph} resistance of motor (between terminals) [Ω] RL line resistance of motor cable [Ω]	

Brake resistor selection of the brake resistor

Step 2 Internal / external Brake-resistor required ? see data in chapter 1.3.3 / 1.3.4	Example-Drive type 637f/K D6R04-7																																						
In case of unsufficient capability or not included internal Brake-Resistor, a type may be selected from the following list External and internal Brake-Resistors will be switched in parallel. The internal and external performance-Data may be added in this case.	acc. to data in 1.3.3: internal resistor: Cont. Power Pd = 30W Peak Power Pmax = 1700W Required: Pd = 9,3W Pmax = 405W Result: The internal capability is sufficient

5.8.2 Configuration of the brake resistor

Possible ballast circuit configurations at digital devices

a) Compact design

The plug-in modules of servo-control series 635/637/637+/637f are provided with an on board ballast electronics. It is intended for application as compact unit KDER resp. KD6R.
 These compact units contain the necessary ballast resistor incl. fuse for the ballast circuit.
 Except KD6R 16..30-7 (external resistor only).

b) Rack design

While the plug-in modules are used in a rack, the NEB power supply module takes dissipation of the braking energy (adjustment of ballast monitoring: please see NEB manual).
 In this case the ballast electronics of the plug-in module will be deactivated with the configuration parameter "Ballast activate = N". All further ballast parameters are no longer relevant then.

r.g. a) Adjustment of ballast circuit for compact units:

1. **Ballast electronics activated:**

In this case the ballast electronics of the plug-in module will be activated. "Ballast activate = J".

2. **Operating point:**

The operating point has to be adjusted dependent on the voltage variant.

"Ucc Ballast on = 375 V" for 230 V AC supply

"Ucc Ballast on = 720 V" for 400..460 V AC supply

3. **Resistance value:**

As resistance value, the parallel resistance from internal and external resistance has to be adjusted.

4. **Rated power:**

As ballast power (braking energy), the sum total of internal and external resistor power has to be adjusted.

Precondition for correct monitoring of shunted ballast resistors is the nearly same ratio of P - cont. power to P - pulse power. This is guaranteed with the SSD Drives standard combinations.

..KD6R 16..30-7 units do not contain an internal ballast resistor.

At these versions the values of the external resistor can be feed directly.

Brake resistor selection of the brake resistor

Example:

Evaluation resistance value in use of internal and external resistances.

Internal "Ballast resistances = 300 Ohm" for ..KD6R10..-7

External "Ballast resistances = 100 Ohm" for ..KD6R10..-7

$$\text{formula : } \frac{1}{R_{\text{total.}}} = \frac{1}{R_{\text{int.}}} + \frac{1}{R_{\text{ext.}}}$$

$$\frac{1}{R_{\text{total.}}} = \frac{1}{300\Omega} + \frac{1}{100\Omega} \Rightarrow R_{\text{total.}} = 75\Omega$$

Set up resistance value = **75 Ohm**

Evaluation Ballst power in use of internal and external Ballast power.

Internal "Ballast power = 30 Watt" for ..KD6R10..-7

External "Ballast power = 100 Watt" for ..KD6R10..-7

$$\text{formula : } P_{\text{total.}} = P_{\text{int.}} + P_{\text{ext.}}$$

$$P_{\text{total.}} = 30W + 130W \Rightarrow P_{\text{ges.}} = 130W$$

Set up rated power = **130 Watt**

Caution !

Placing of external brake resistors

Brake-resistor are dissipating heat !

Make sure, that there will be no fire-danger in case of operating the resistor in nominal- or fail-conditions

6.1 General Information

Digital servo drives are designed for **operation in metallic grounded enclosures**. For perfect operation as well as for observance of all regulations the **front board must be connected with the enclosure electrically and fixed**.

6.2 Control cabling

Recommended cross section 0,25 mm². The control signal lines must be laid separate from the power signal lines. (see chapter 6.7.1)

The resolver cable must contain three shielded pairs **and** must be shielded as a whole. The shielding should be connected to the ground spread out on the regulator side. We recommend using SSD Drives resolver cable **KIR**. Cable for transmitting data are always to be laid shielded !

6.3 Power cabling

Recommended section according to rated current. Use only 75° Cu-cables.

6.4 Installation of the rack

When the rack is secured not in a hinged bay but on a mounting plate, it is recommended to do the wiring of the connections for the power connector X50 on the rear of the rack before installing. With hinged-bay installation, the customer must ensure that the parts sensitive to voltage such as the Ucc bus, mains supply lines, etc., are protected against electric shock.

6.5 Analog setpoint

The setpoint input is a differential input. Therefore the poling can be done depending on the requirements. Important: the setpoint voltage must be galvanically connected to the reference potential of the control connections (plug X10). It is possible to connect one pole directly to GND.

6.6 Safety rules

CAUTION !

Plug / unplug all modules only when Ucc (DC-BUS) is off, that is, the green LED on the power supply module is off and the discharge time > 3 minutes has elapsed.
The user must ensure protection against accidental touching.

6.7 Electromagnetic compatibility (EMC)

Conformity in accordance with the EEC Directive 89/336/EEC has been evaluated using a reference-system, consisting of a compact type drive and a line-filter on mounting-plate, connected to an AC-synchronous motor.

Mainly responsible for EMC-emissions is the motor cable. So this has to be installed exepotional carefully. The layout of grounding is very important. Grounding has to be low-impedant for high frequencies. That means, all ground-connecting parts have to use area.

The measurements made are valid under the use of SSD Drives - cables, suppression aids and line filters and by application of the following wiring instructions:

Electromagnetic compatibility (EMC)

6.7.1 Hints for mounting

A	All components are mounted inside of a steel control cubicle on a mounting plate (thickness min. 3mm). Recommended: Galvanizing	
B	The connection between drive housing filter-housing and mounting-plate must be blank and not reduced by varnish. All screws must be well fixed !	
C	Use only SSD Drives-filters and cables for motor and resolver	
D	Place all wires and cables as close as possible to any grounded metal parts	
E	Separate power- and control cables. Minimum distance: 0,3m crosspoints: 90°	
F	Avoid cable-loops. Especially the line between line-filter and drive has to be as close and short as possible (drilled)	
G	Maintain screen as close as possible to the cable-end (max distance 8 cm)	
H	Connect screen-connections according to general view of connetions, see chapter 2.1. Ground screens on both sides, shortest way. For long cables: Connect additional screen-area along the way	
I	Connect screens area-contacted to good grounded points	
K	Connect unused wires in cables to ground	
L	Install control cables directly close to grounded metal-parts or screend when leaving the control-cubicle	
M	Take care for good grounding of control-transformer (DC 24V). Use transformer with metal-socket and take care for conductive contact to mounting-plate	
N	Take care for good general grounding of the complete system. Interconnect several mounting-plates with copper-rails or copperband. Take care for ground connection between control-cubicle and machine !	

Electromagnetic compatibility (EMC)

6.7.2 Example for mounting

6.7.3 Achievable specifications and conditions

			Standard	conditions		additional conditions	
	Area	Class		Motor-cable length	Area	Class	Standard
Emissions: transmitted by cable or by air	Industrial	A	EN50081-2/ EN55011 Klasse A	see chapter 5.6	LNF S/E LNF B	closed cabinet with ≥ 15 dB attenuation	toroidal ferrite cores see chapter 5.6

7.2 Digital communication

see: Chapter 13

**CAUTION !**

**Wiring errors or incompatible operation may cause unpredictable motions.
Avoid danger for man and machine !**

8.1 Preparation

- For PC-link use the SSD Drives communication software EASYRIDER® Windows - Software. For the start, we suggest exercises in simulation mode to get familiar with EASYRIDER. This chapter presumes the knowledge how to handle EASYRIDER. Suggestions: Use test equipment to train yourself. EASYRIDER® Windows - Software contains interactive HELP - functions.
- For security-reasons the access to several functions is blocked by password. Commissioning has to be executed by trained staff only.
- Users may have their application-adapted commissioning methods when familiar with the product, on their own responsibility.
- The system must be in accordance with all valid safety specifications. The function of all safety equipment (limit-switches for example) have to be checked.
- To activate the power-stage of the drive, the "ACTIVE"-signal (X10.22 against X10.9) has to be exited.

Hint: With the assembly of the option module SBT you kindly note the extended functions of the signals
(see documentation 07-02-10-02-E..)

8.2 Commissioning in steps

Step	Action		Remark	
1	Before switching on Check the wiring, especially: Filter polarity, supply Motor wiring, motor polarity Resvolver wiring, polarity (or other feedback systems)			
2	With critical mechanical part: remove motor shaft from application		avoid danger	
3	Connect PC by RS232 link to the drive service port COM1 and start EASYRIDER [®]			
4	Set up state NOT ACTIVE		7-segment-dispay	
	635/ 637/ 637+/ 637f ¹⁾	631		
	X10.22 against X10.9	X10.7 against X10.4		
	Power on			
5	Switch on control voltage		7-segment-dispay	
	635/ 637/ 637+/ 637f	631		
	Us = 24V DC	Us = 230V AC		
	EASYRIDER [®] communicates (see diagnosis F9)			
6	Are parameters already evaluated?			
	Yes: load parameter-file xxx.WDD. Store parameters in the drive. If existent: load BIAS-file xxx.WBD and store in drive. Proceed with 10 or 15 (experts)	No: continue with 7		
7	Menu Commissioning: Select the used motor from the EASYRIDER [®] - Library Adjust max. current to nominal motor current or smaller		reduced torque	
8	When leaving that menu: Tuning-parameters for current loop will be calculated and offered to the user. Normally, these values give dynamic servo motion.		Confirm acceptance of offered parameters	
9	Store data power-fail-save in the drive			
10	Menu: Tuning speed loop			

¹⁾ **Hint:** With the assembly of the option module SBT you kindly note the extended functions of the signals (see documentation 07-02-10-02-E..)

Commissioning in steps

Step	Action	Remark	
11	"ACTIVE" switched	7-segment-dispay	
12	Adjust test generator as required. Activate test generator with "START F8". Activate graph to display motor current or speed. Can be optimize manually (P- and I- gain)		
13	Is the result ok?		
	Yes: continue with 14 No: continue with U1		
14	Preparation to the position controller The commissioning of the position controller is first recommended without linked mechanics. In the case of secure function, the mechanics can then be linked up.		
15	Power OFF. Connect motor-shaft to application Move application to a free area between mechanical limits. Power ON. Menu: Tuning position loop		
16	Adjust test generator. Select Pos. 1 and Pos. 2 to uncritical value. Select slow speed and low acceleration first, rise up later	mind: reaction-time- to Emergency stop	
17	"ACTIVE" – switched. Every activation of "START F8" excites a motion form Pos. 1 to Pos 2 and with next activation, form Pos. 2 to Pos. 1		
18	Observe the behaviour of application and graph. Optimize tuning-parameters (P-, I- and V gain)		
19	Is the result ok?		
	Yes: continue with 20 No: continue with 9		
20	Basic power-up is done now. Further functions (Interfaces, fieldbus functions, synchronizing and so on may be done adapted to selected equipments		
21	Select the menu "File" store parameters" and store the data in the regulator, protect against lost, with F7-key	data save	

Commissioning in steps

Step	Action	Remark				
U1.1	Menu: Tuning Speed Loop Stabile parameters are calculate bases on the system data; and can be called up with “Default value”. Sometimes it is recommended to make further manual tuning. Rated value can be soured either digital by the internal generator or analogue by <table><tr><td>635/ 637/ 637+/ 637f</td><td>631</td></tr><tr><td>+/- 10V at X10.5/18</td><td>+/- 10V at X10.1/2</td></tr></table> ATTENTION! Too hard tuning will cause current-ripple and high power dissipation.	635/ 637/ 637+/ 637f	631	+/- 10V at X10.5/18	+/- 10V at X10.1/2	Motor current  P- gain too high or I-time constant too small Motor noise
635/ 637/ 637+/ 637f	631					
+/- 10V at X10.5/18	+/- 10V at X10.1/2					
U1.2	Too weak adjustment cause slow loops reactions that may cause problems for the tuning of position loops.	Speed  P- gain too small or I-time constant too high				
U1.3	It the result ok? Yes: continue with 9	No: continue with U2.1				
U2.1	Menu: Tuning Current Loop Stable parameters are calculated bases on the system data and can be called up with “default value” Manual tuning may be useful. Rated value can be soured either digital by the internal generator or analogue by <table><tr><td>635/ 637/ 637+/ 637f</td><td>631</td></tr><tr><td>+/- 10V at X10.5/18</td><td>+/- 10V at X10.1/2</td></tr></table> ATTENTION! Tuning of current loops should be only done after consultation of SSD Drives experts. continue with 9	635/ 637/ 637+/ 637f	631	+/- 10V at X10.5/18	+/- 10V at X10.1/2	
635/ 637/ 637+/ 637f	631					
+/- 10V at X10.5/18	+/- 10V at X10.1/2

The error signals are shown as long as there is control voltage (Us), also when the power (DC-Bus) is switched off for safety reasons.

9.2 Reset of a regulator trouble

A general precondition for correct execution of the Reset is the elimination of the error cause.

The error signals

of the drive can be reset via:

1. Control voltage OFF/ON,

2. the serial command "Drive Reset" 0x02

The host login must be occurred.

The drive must be deactivated via the serial command "deactivate Drive" 0x00.

3. the fieldbus-command " Drive Reset" 0x16 (22 decimal)

The host login must be occurred via the BUS command 0x01. The drive must be deactivated via the BUS command "deactivate Drive" 0x14.

The fieldbus command "Drive Reset" with constant repetition of the fieldbus command 0x16 will be works-off only once.

For further processing, it is necessary, meanwhile to send another control word (e.g. 0 status order).

4. a 0 – 1 flank on input X10.11

Precondition:

- The input X10.11 is with function 1 "Reset drive fault" configured (EASYRIDER® Windows – Software)
- There is no host login.
- The input Active, (X10.22) is inactive (0V) ¹⁾
- The signal must be present min. 250 ms

Notice !!

After remove of the tracking error deactivation  the warning message  (tracking error) is active up to the next move command.

The **error signal** (releasing before ready) can be reset by deactivation the drive.

¹⁾ **Hint:** With the assembly of the option module SBT you kindly note the extended functions of the signals (see documentation 07-02-10-02-E..)

9.3 Trouble shooting

The following list refers to faults which can occur during operation.

Display:

Error	Explanation and remedy	
no motor run despite current flow	motor mechanically blocked? motor brake released?	1)
motor runs unevenly	check setpoint wiring check grounding and shielding too high P-amplification in the speed controller reduce value (with EASYRIDER® setting/speed control) too small I-time in the speed controller? reduce value (with EASYRIDER® setting/speed control)	
no reaction of setpoint progression, despite torque in standstill	Limit switch functions effective (BIAS)	
no current flow; no torque despite activating the regulator correctly	motor cables interrupted? Is input "I extern" (X10.19) activated (config. menu) and not notched up? limit switch - input activated and not notched up?	
Interference symptoms with power frequency	Ground loops in setpoint or actual value wiring? Shieldings laid on both sides? Signal cables near high voltage cables?	
Motor takes up preferred positions after activation	Position encoder or motor cables with reversed poles? Resolver or Feedback- encoder incorrectly adjusted? Number of motor poles wrong matching? (config. menu)	1)
Motor runs up immediately after activation although there is no setpoint	Motor cables or feedback- cables reversed? Encoder incorrectly adjusted? (e.g. Resolver)	1)
Motor reaches in idling cycle very different speed when running to the right or to the left	Feedback-Encoder incorrectly adjusted (e.g. Resolver)

specification in accordance with	UL 508C and cUL
short circuit and to frame proof for	Min. 2000 releasings
overvoltage monitoring D6R...-3	Max. 400V DC $\pm 5V$ DC
overvoltage monitoring D6R...-7	Max. 765V DC $\pm 10V$ DC
undervoltage monitoring	min. 15V DC; configurable
overtemperature switch off at	95 ° C $\pm 5\%$
clock frequency	4,75 kHz
frequency of current ripple	9,5 kHz

11.2 Control circuit

galvanic separation from power circuit	in acc. with EN 50178 / VDE 0160
further information:	see concept of insulation chapter 1.3.1
	see data compact units chapter. 1.3.3
	see data plug-in modules chapter 1.3.4

11.3 Signal inputs and outputs, connection X10

additional galvanic separation from power and control circuit		
nominal voltage of the in- and outputs	24 V DC	
number of outputs signal outputs via OPTO coupler	5 U _{max} = 45V DC; I = 0..60 mA; short circuit proof, resistive load	
signal outputs via RELAY	U _{max} = 45V DC; I = 1uA...1,2A	
contact protection with inductive load	internal varistor	
number of inputs signal outputs via OPTO coupler	8 L = 0...7 V DC or open H = 15...30 V DC I _{in} 24VDC: 8 mA	
Shortest time of signal at all input to accept the signal in an application:	> 1 ms	
Damping of the transfer from low to high (0-->24V):	fast input: 20µs (X10.4, X10.25)	Damping of the transfer from low to high (0-->24V):
Interrupt response time for fast input	10µs (X10.4, X10.25)	
Damping of the transfer from high to low (24-->0V)	fast input: 250µs (X10.4, X10.25)	Damping of the transfer from high to low (24-->0V)

11.4 Signal inputs and outputs, connection X120B resp. 120C

Damping of the transfer from low to high (0-->24V):	default input: 200µs																					
Damping of the transfer from high to low (24-->0V)	default input: 1000µs																					

11.5 Digital control

current control	
Loop-Cycle-Time	105 µs
settings	according to factory specifications or motor data
current limits, Adjustment by:	speed control -menue
	Analog Input
	0..10V = 0..100%; can be normed, 10Bit

speed control	
Loop-Cycle-Time	105 µs
settings	speed control menue
differential setpoint input analog resolution (including sign)	U _{Soll} = 10 V, can be normed; R _i = 10k
	14 bit
digital setpoint input	via interfaces

position control	
Loop-Cycle-Time	105 µs

11.6 Digitale communication

RS232 - service interface	COM1 19200 baud, 8 databits, 1 startbit, 1 stopbit, parity: even
<u>Optional</u> RS232 / RS422 / RS 485 on SUB D – socket	COM2
CAN1, Profibus DP, SUCOnet K on SUB D – socket Interbus S on SUB D – socket (OUT)	
Interbus S (Remote IN) CAN2	additional on SUB D – socket

11.7 Resolver evaluation/transmitter principle

<u>General:</u> The specified data refer to the combination of the standard resolver interface with Function-Module X300_RD2; operated with the SSD Drives resolver R 21-T05, R15-T05	
carrier frequency	$f_t = 4,75 \text{ kHz}$
ripple of the speed actual value signal	2% ¹⁾
max. position resolution for one revolution	65536 / 16 bit
absolute position accuracy	$\pm 0,7^\circ$ ¹⁾
relative position accuracy	$\pm 0,08^\circ$ ¹⁾

¹⁾ Data under check, Reality: Quality improved

11.8 Controllersystem

system run-up time after switching on the control voltage	max. 6 sec.
data memory / organization	Flash Eprom 256 KB RAM 64 KB; EEPROM 96 kByte

11.9 Analog-Outps

measuring pin X10.17

signal range	-10V.....0.....+10V magnifier function can be normed
resolution	10 bit, independend of norming
internal resistance	1,8 kOhm

measuring pin X10.6

signal range	-10V.....0.....+10V magnifier function can be normed
resolution	8 bit, independend of norming
internal resistance	1,8 kOhm

11.10 Thermal data

thermal data	see chapter 1.3
--------------	-----------------

11.11 Mechanical data

dimensions	see chapter 1.4
weight	see chapter 1.3

Further data you will find in chapter 1.3

The digital servo drive consists of different materials.

The following table shows, which materials can be recycled and which have to be disposed of in a special way.

material	recycle	disposal
Metal	yes	no
plastics material	yes	no
printed board assembly	no	yes

Dispose of the appropriate materials in accordance with the valid environmental control laws.

13.1 EASYRIDER® Windows - Software

EASYRIDER® Windows - Software is an comfortable tool to use all drive functions. Detailed Online-Help-information's and instruction are available.

EASYRIDER® Instructions: (extract)

- Autopilot-function as interactive tutorial
- System identification
- BIAS - instruction-set editor
- Oszilloscope-function
- start-up and comissioning-tools
- Setting of parameters, Setting of configurations
- Servo-diagnostics, Interface diagnostics, Fieldbus diagnostics
- Motor library
- save system data in file, load system data from file
- send system data to servo drive, save system data in servo drive
- load system data from servo drive

Important:

Edited data in EASYRIDER® are transmitted to the RAM of the servo drive and **active after** use of the instruction **SEND**. **Only the instruction SAVE in EEPROM** writes data into a not volatile memory. Data are stored there power-fail save.

13.2 SSD Drives programming language BIAS

In **Operating mode 5** – Position control with BIAS, three user-defined programs can be executed parallel. The BIAS-program and the PLC-program (sequence cascades, 1 command per position controller sampling = 844 μ s) as well as the Mathematics program (cyclic execution in remaining time of processor).

The BIAS-program is primary intended for administration of travel commands. If application permits, also simple calculations can be performed and analog/digital I/O's can be serviced in this task. The PLC-task is conceived to perform I/O logic, sequence control, monitoring and CAN-Bus communication.

The Mathematics program is designed for complex calculations, e.g. computing of a cam, executed by the BIAS-program afterwards. But it is also possible to store the same tasks here, as basically defined for PLC-task, which can increase PLC performance of the 637+ controller approx. twenty times.

While the BIAS-program will be executed from the start block directly after activation of **operating mode 5**, the PLC-program will be first started by BIAS-command "PLC-program" and the Mathematics program by command "Mathematics program". At reaching the command "End of program" (Mode = 0) the respective execution pointer re-jumps to his start label. Within the command set the following command groups are provided:

Program flow control

- Fixing start/end of main- and sub-programs
- Conditional and unconditional jump commands

Travel relevant commands

- Positioning commands
- Parameter commands
- Technology functions
 - >Register positioning
 - >PID-control
 - >Synchronous applications

Logic commands

- Logic commands for coils and internal relays

Variable commands

- Writing and reading of parameters
- Fundamental operations of arithmetic with long integer
- Type-conversions long integer $\Leftrightarrow$ double float (Math.task only)
- Fundamental operations of arithmetic with double float (Math.task only)
- SIN(x),COS(x),SQRT(x) with double float (Math.task only)
- Writing and reading of synchronous profile tables.

CAN-Bus commands

- Communication with other SSD Drives products

SSD Drives programming language BIAS

The user has the possibility to program his sequence himself from this set of commands.

Available program area	
Set number	
0000 -	
...	
...	can be selected via
...	data inputs X10.xx
...	max. to block no. 63 and
...	and Strobe X10.2
...	
0063 -	
...	
...	
1499	last block

The BIAS operation set is listed on the next page.

You can read the exact function of the individual commands in the help function of the EASYRIDER® Windows -Software in the BIAS editor or in the BIAS command description (10-06-05-E-Vxxxx).

13.3 BIAS – Commands

Position = const.	[Variable X] = position	BIAS-execution pointer	[Variable X] = flag Y	Profile value = [variable X]	Save table	PLC-program
This command is only permitted in the BIAS- task	This command is only permitted in the BIAS, PLC and MATH-Task	This command is only permitted in the PLC and MATH-Task	This command is only permitted in the BIAS and PLC -Task	This command is only permitted in the MATH-Task	This command is only permitted in the MATH-Task	This command is only permitted in the BIAS and MATH-Task

	0	1	2	3				7	8	9	A	B
0	Move position	Move position + parameter	Position = const.	Position = [variable X]	[Variable X] = position	NOP	Flag X = const.	If input X ? const.	[Variable X] = const.	Mathematic program	Table [[variable X]] = const.	[D Variable X] = [D Variable Y] + [D Variable Z]
1	Move incremental position	Move incremental position + parameter	Speed = const.	Speed = [variable X]	[Variable X] = speed	End of program	If flag X ? const.	If output X ? const.	If [variable X] ? const.	Profile initialization = const.	Table [[variable X]] = [Y Variable Z]	[D Variable X] = [D Variable Y] - [D Variable Z]
2	Move datum	Move datum + parameter	Acceleration = const.	Acceleration = [Variable X]	[Variable X] = acceleration	Sub-program	Flag X = flag Y	Output X = const.	[Variable X] = [variable Y] + const.	Profile cycle length = [variable X]	[X Variable Y] = Table [[variable Z]]	[D Variable X] = [D Variable Y] * [D Variable Z]
3	Move infinite positive	Move infinite positive + parameter	Deceleration = const. The designated product is in conformity with the European Directive:

73/23/EEC
including amendments

"Council Directive of 19 February 1973 on the harmonization of the laws of the Member States relating to electrical equipment designed for use within certain voltage limits".

Full compliance with the standards listed below proves the conformity of the designated product with the provisions of the above-mentioned EC Directive:

DIN EN 50178 (VDE 0160):1998-04; EN 50178:1997

The VDE Testing and Certification Institute (EU Identification No. 0366), Merianstr. 28, D-63069 Offenbach, has tested and certified the product granting the VDE Licence for the mark(s) as displayed.
